MyPBX and EasyLynq Integration

Feature Guide

===Firmware Version: V15.19.351.432==

Applicable Model: MyPBX U100/U200

Release Date: June 30, 2015

Yeastar Information Technology Co. Ltd.

Introduction:

MyPBX and EasyLynq are integrated for billing purposes for EasyLynq Enterprise/Server and EasyLynq Hotel.
The version of MyPBX is 15.19.351.432.

1. EasyLynq Office/Server Integration Feature

The implementation of call accounting requires the installation and configuration of a MySQL ODBC data source in the PBX Agent computer. When PBX Agent establishes an ODBC connection to MyPBX database, EasyLynq Office/Server will be able to:

- Retrieve the call records data and stores them in its own database after processing.
- Extract CDR from the database using the *uniqueid* field as the query filter.

2. EasyLynq Hotel integration Feature

The AMI Hospitality Service is available starting on MyPBX and hosted on all subsequent MyPBX platforms.

MyPBX AMI interface implements the following basic services:

- Check-in, with the assignment of the guest's name and language to the room phone sets and permission for outward access.
- Check-out, forbidden for establishing outgoing calls.
- Do Not Disturb service.
- Message Waiting Indicator, to signal new voice mail messages and written messages at the hotel reception.

EasyLynq SIP Messaging interface extends the hospitality service to a higher level, adding the following features:

- Full wake-up service (set / cancel / change / answer control), in nine languages.
- Room-status.
- Minibar/Laundry posting.

EasyLynq IVTS Hotel can replace SIP Messaging and adds advanced functionality such as voice mail in 9 languages for guests and staff, Text-To-Speech and much more.

3. EasyLynq officially Supported PMS
