1. Introduction

**MyPBX—IP-PBX for Medium Businesses/Home Office**

MyPBX U5 series is a standalone embedded hybrid PBX for medium businesses and remote branch offices of larger organizations (1-500 users per site). MyPBX U5 series also offer a hybrid solution (a combination of VoIP applications using E1/T1/J1 equipment) alternative for enterprises who are not yet ready to migrate to a complete VoIP solution.

**FCC Statement**

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radiofrequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

**FCC Caution**

Any changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate this equipment.

**FCC Warning**

This equipment has been tested and found to comply with the regulations for a Class B digital device, pursuant to Part 15 of the FCC Rules. Operation is subject to the following two conditions:

1. This device may not cause harmful interference.
2. This device must accept any interference received including interference that may cause undesired operation.

2. System Setup

2.1 Connection Drawing

Figure 2-1 U5XX Connection Drawing
2.2 Connecting Ethernet Line

MyPBX provides two 1000M Ethernet ports with RJ45 interface and LED indicator. Plug Ethernet line into MyPBX’s Ethernet port, and then connect the other end of the Ethernet line with a hub, switch, router, LAN or WAN. Once connected, check the status of the LED indicator. A yellow LED indicates the port is in the connection process, and a green LED indicates the port is properly connected.

2.3 Supplying Power

Please follow the steps below to connect the MyPBX unit to a power outlet:
1. Connect the small end of the power cable to the power input port on the MyPBX back panel, and plug the other end of the cable into a 100V~240V AC power outlet.
2. Check the Power LED on the front panel. A solid green LED indicates that power is being supplied correctly.

3 Administrator Login

From your web browser, input the IP address of the MyPBX server. If this is the first time you are configuring MyPBX, please use the default
settings as below (your PC should be in the same local network with MyPBX):
IP Address: http://192.168.5.150

**Note:** MyPBX supports multiple administrators in hierarchical mode
(Administrator, General Manager, CDR Manager)
- **Administrator**
  has all the authority.
  Username: admin, Password: password

- **General Manager**
  has basic authority; without the advanced authority to create VoIP trunks, reset, update, backup and restore MyPBX.
  Username: user, Password: password
  You should enable this account before you use it.

- **CDR Manager**
  only has the authority to check the call recordings.
  Username: cdr, Password: password

In this example, the IP address is 192.168.5.149

![Figure 3-1 Login Page](image)

This is the welcome page of MyPBX U5XX after successful login.
You can also login via HTTPS protocol

Like https://192.168.5.147, you will see a prompt that is a certificate problem. Click “Continue to …”, then you can login after entering user and password. HTTPS is HTTP over SSL, and it is safer than HTTP.

Note:
MyPBX firmware upgrade follow-up
• Reboot the device twice to make the new firmware take effect
• Clean the cache and cookies of the browser before login.
• There is a compatibility issue with IE11. Configure IE11 browser "Compatibility View Settings", add MyPBX IP address, and check "Display Intranet sites in Compatibility View" and "Use Microsoft compatibility lists". See the following picture. MyPBX IP is 192.168.5.147 in this example.

Figure 3-4 Login Page in IE11

Figure 3-5 Compatibility View Setting
4 Status

Click to start to check the status of MyPBX U5XX, where we can check the status of extensions, trunks, and network and system information.

4.1 Line Status

In this page, we can check the status of extensions and trunks

4.1.1 Extension Status

MyPBX Status Description:

**Extensions:**

1) ![icon](image) : Extension is unavailable

2) ![icon](image) : Extension is idle

3) ![icon](image) : Extension is ringing

4) ![icon](image) : Extension is busy

5) ![icon](image) : Extension is on hold
4.1.2 Trunk Status

![Trunk Status Page]

**Trunks:**

**Note:**

**E1/T1/J1 trunk in MyPBX U5XX**

<table>
<thead>
<tr>
<th>Trunk Name</th>
<th>Type</th>
<th>Connected</th>
<th>Alarm</th>
</tr>
</thead>
<tbody>
<tr>
<td>E1Trunk1</td>
<td>E1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>E1Trunk2</td>
<td>E1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**VOIP Trunk:**

**Status**
- Rejected: Trunk registration failed.
- Registered: Successful registration, trunk is ready for use.
- Request Send: Registering.
- Waiting: Waiting for authentication.

**Service Provider:**

**Status**
- OK: Successful registration, trunk is ready for use.
- Unreachable: The trunk is unreachable.
- Failed: Trunk registration failed.

**FXO Trunk:**

**Status**
- Idle: The port is idle.
- Busy: The port is in use.
- Disconnected: The port hasn't connected to the PSTN line.

For more details, please refer to the LED indication of front panel.

**GSM Trunk:**
**Status**
- **Idle**: The port is idle.
- **Busy**: The port is in use.

**Signal**
- 🅱️: No signal.
- 🅱️: Poor.
- 🅱️: Average.
- 🅱️: Good.
- 🅱️: Excellent.

**BRI Trunk:**

**Status**
- **Ok**: The ports connect correctly.
- **Disconnected**: The port hasn’t connected to the BRI line or the signaling mismatch.

**E1 Trunk:**

<table>
<thead>
<tr>
<th>Connect</th>
<th>Alarm</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>🅱️</td>
<td>🟥</td>
<td>The port doesn’t have E1 line connected.</td>
</tr>
<tr>
<td>🟢</td>
<td>🟥</td>
<td>E1 line has been connected to the port; PRI is in corresponding or can’t communicate.</td>
</tr>
<tr>
<td>🟢</td>
<td>🅱️</td>
<td>Succeed.</td>
</tr>
</tbody>
</table>
4.2 System Status

In this page, we can check the status of MyPBX system, including the hardware, firmware version and the network status of LAN and WAN ports.

4.2.1 System Info

In this page, we can check the hardware/firmware version, or the disk usage of MyPBX.

![System Information](image)

4.2.2 Network Status

In this page, the IP address of LAN and WAN port will appear. If OpenVPN is configured well, the information will be displayed here too.

![Network Status](image)
5 System

Click to access.

In this page, we can configure the network settings, security settings, LDAP Server, storage management and system preferences.

5.1 Network Preferences

5.1.1 LAN Settings

![LAN Settings](image)

**Figure 5-1 LAN Settings**

- **DHCP**
  If this option is set, MyPBX will use DHCP to get an available IP address from your local network. Not recommended as without the right IP address you cannot access MyPBX.

- **Enable SSH**
  This is the advance way to access the device, you can use the putty software to access the device. In the SSH access, you can do more advanced settings and debug. It’s disabled by default.

- **Port**: the default is 8022; you change it to another one.

- **Enable FTP**
  Users will be able to log in MyPBX via FTP if FTP is enabled. You can access FTP resource on MyPBX via Windows explorer or Web browser.
FTP default user: **root**, password: **ys123456**

- **Port**: the default is 21; you change it to another one.

- **Hostname**
  Set the host name for MyPBX.

- **IP Address**
  Set the IP Address for MyPBX.
  Configuring a static IP address for MyPBX is recommended.

- **Subnet Mask**
  Set the subnet mask for MyPBX.

- **Gateway**
  Set the gateway for MyPBX.

- **Primary DNS**
  Set the primary DNS for MyPBX.

- **Secondary DNS**
  Set the secondary DNS for MyPBX.

- **IP Address2**
  Set the second IP Address for MyPBX.

- **Subnet Mask2**
  Set the second subnet mask for MyPBX.
5.1.2

It supports three connection types: DHCP (obtain an IP automatically), PPPoE, Static IP Address.

**Notes:**
1. WAN port is disabled by default.
2. WAN port cannot be used as a router to route the internet packages from WAN port to LAN port.

- **DHCP**
  If your ISP says that you are connecting through DHCP or a dynamic IP address from your ISP, perform these steps:
  Step1: Select **DHCP** as the WAN Connection Type.
  Step2: Click **Save** button to save the settings.
  Step3: Reboot the device.
  Step4: Check the WAN’s Status (Status → Network status).

- **Static IP Address**
  If your ISP says that you are connecting through a static or fixed IP address from your ISP, perform these steps:
  Step1: Select **Static IP Address** as the WAN Connection Type.
  Step2: Enter the IP Address.
  Step3: Enter the Subnet Mask.
  Step4: Enter the Gateway Address.
  Step5: Enter the Primary DNS and Secondary DNS.
  Step6: Click the **Save** button to save the settings.
  Step7: Reboot the device.
  Step8: Check the WAN’s Status (Status → Network status).
• **PPPoE**
  If your DSL provider says that you are connecting through PPPoE or if you normally enter a user name and password to access the Internet, perform these steps:
  Step1: Select **PPPoE** as the WAN Connection Type.
  Step2: Enter the User Name.
  Step3: Enter the Password.
  Step4: Click the **Save** button to save the settings.
  Step5: Reboot the device.
  Step6: Check the WAN’s Status (Status → Network status)

### 5.1.3 DHCP Server

Dynamic Host Configuration Protocol (DHCP) is a network protocol that enables a server to automatically assign an IP address to a computer from a defined range of numbers (i.e., a scope) configured for a given network. You can also set a local network NTP server for MyPBX here.

**Note1:** When using “Phone Provisioning” for Grandstream IP phone, enter the IP address of the server directly, e.g. 192.168.5.150; for other phones use the default configuration.

**Note2:** MyPBX USXX can work as a DHCP server, but cannot be regarded as a router.

![Figure 5-3 DHCP Server Settings](image)
A VLAN (Virtual LAN) is a logical local area network (or LAN) that extends beyond a single traditional LAN to a group of LAN segments, given specific configurations.

**Note:** MyPBX U5XX is not the VLAN server, a 3-layer switch is still needed, please configure the VLAN information there first, then input the details in MyPBX, so that the packages via MyPBX will be added the VLAN label before sending to that switch.

![VLAN Settings](image)

**Figure 5-4 VLAN Settings**

1) VLAN Over LAN

- **NO.1**
  Click the NO.1 you can edit the first VLAN over LAN.

- **VLAN Number**
  The VLAN Number is a unique value you assign to each VLAN on a single device.

- **VLAN IP Address**
  Set the IP Address for MyPBX VLAN over LAN.

- **VLAN Subnet Mask**
  Set the Subnet Mask for MyPBX VLAN over LAN.

- **Default Gateway**
  Set the Default Gateway for MyPBX VLAN over LAN.
·NO.2
Click the NO.2 you can edit the first VLAN over LAN.

·VLAN Number
The VLAN Number is a unique value you assign to each VLAN on a single device.

·VLAN IP Address
Set the IP Address for MyPBX VLAN over LAN.

·VLAN Subnet Mask
Set the Subnet Mask for MyPBX VLAN over LAN.

·Default Gateway
Set the Default Gateway for MyPBX VLAN over LAN.

2) VLAN Over Wan

·NO.1
Click the NO.1 you can edit the first VLAN over WAN.

·VLAN Number
The VLAN Number is a unique value you assign to each VLAN on a single device.

·VLAN IP Address
Set the IP Address for MyPBX VLAN over WAN.

·VLAN Subnet Mask
Set the Subnet Mask for MyPBX VLAN over WAN.

·Default Gateway
Set the Default Gateway for MyPBX VLAN over WAN.

·NO.2
Click the NO.2 you can edit the first VLAN over WAN.

·VLAN Number
The VLAN Number is a unique value you assign to each VLAN on a single device.

·VLAN IP Address
Set the IP Address for MyPBX VLAN over WAN.

·VLAN Subnet Mask
Set the Subnet Mask for MyPBX VLAN over WAN.

·Default Gateway
Set the Default Gateway for MyPBX VLAN over WAN.
5.1.5 VPN Settings

A virtual private network (VPN) is a method of computer networking—typically using the public internet—that allows users to privately share information between remote locations, or between a remote location and a business home network. A VPN can provide secure information transport by authenticating users, and encrypting data to prevent unauthorized persons from reading the information transmitted. The VPN can be used to send any kind of network traffic securely. MyPBX supports OpenVPN, IPSec and L2TP.

![VPN Settings](image)

- **Enable OpenVPN**

- **Import VPN Profile**
  Import configuration file of OpenVPN. Don't configure “user” and “group” in the “config” file.

- **Enable IPSec**

- **Import VPN Profile**
  Import configuration file of IPSec. There can be only one “lan” in the “conf” file.

- **Enable L2TP**

- **Import VPN Profile**
  Import configuration file of L2TP. There can be only one “conn” in the “conf” file.

Note: for more details about the above VPN settings, please contact our technical support.
DDNS (Dynamic DNS) is a method/protocol/network service that provides the capability for a networked device, such as a router or computer system using the Internet Protocol Suite, to notify a Domain Name System (DNS) name server to change, in real time, the active DNS configuration of its configured hostnames, addresses or other information.

- **Enable DDNS**
- **DDNS Server**
  Select the DDNS server you sign up for service.
- **User Name**
  User name the DDNS server provides to you.
- **Password**
  User account’s password.
- **Host Name**
  **Note**: DDNS allows you to access your network using domain names instead of IP address. The service manages changing IP address and updates your domain information dynamically. You must sign up for service through dyndns.org, freedns.afraid.org, www.no-ip.com, www.zoneedit.com
MyPBX will have more than one internet connection in some situations but it has only one default gateway. You will need to set some Static Route for MyPBX to force it to go out through different gateway when access to different internet. The default gateway priority of MyPBX from high to low is OpenVPN→WAN port→LAN port.

1) Route table
The current route rules of MyPBX

- **Destination**
The destination network to be accessed to by MyPBX

- **Subnet Mask**
Specify the destination network portion.

- **Gateway**
Define which gateway MyPBX will go through when access to the destination network.

- **Metric**
The cost of a route is calculated by using what are called routing metric. Routing metrics are assigned to routes by routing protocols to provide measurable statistic which can be used to judge how useful (how low cost) a route is.

- **Interface**
Define which internet port to go through.

2) Static Route Rules
You can add new static route rules here.
5.2 Security Settings

Firewalls are used to prevent unauthorized Internet users from accessing private networks connected to the Internet, especially intranets. All messages entering or leaving the intranet pass through the firewall, which examines each message and blocks those that do not meet the specified security criteria.

5.2.1 Security Center

You can check MyPBX security configuration in “Security Center” page. And also, you can enter the relevant security settings page rapidly.

**Firewall:**

![Security Center—Firewall](image)

In the “Firewall” tab, you can check firewall configuration and alert settings. By clicking the relevant button, you can enter the configuration page directly.

**Service:**

![Security Center—Service](image)

In “Service” tab, you can check AMI/SSH/TFTP status. For AMI/SSH, you can enter the according page by clicking the button in “Setting” column. For TFTP, you can directly disable or enable it.

**Port:**
In “Port” tab, you can check SIP port and HTTP port. You can also enter the relevant page by clicking the button in “Setting” column.

5.2.2 Firewall Rules

1) General Settings

- **Enable Firewall**
  Enable the firewall to protect the device.

- **Disable Ping**
  Enable this item, net ping from remote hosts will be dropped.

- **Drop All**
  When you enable “Drop All” feature, system will drop all packets or connection from other hosts if there are no other rules defined. To avoid locking the devices, at least one “TCP” accept common rule must be created for port used for SSH access, port used for HTTP access and port sued for CGI access.
2) Common Rules
There is no default rule; you can create them as required.

![Firewall Rule Interface](image)

**Name**
A name for this rule, e.g. "HTTP".

**Description**
Simple description for this rule. E.g. Accept the specific host to access the web interface for configuration.

**Protocol**
The protocols for this rule.

**Port**
Initial port should be on the left and end port should be on the right. The end port must be equal to or greater than start port.

**IP**
The IP address for this rule. The format of IP address is: IP/mask
- E.g. 192.168.5.100/255.255.255.255 for IP 192.168.5.100
- E.g. 216.207.245.47/255.255.255.255 for IP 216.207.245.47
- E.g. 192.168.5.0/255.255.255.0 for IP from 192.168.5.0 to 192.168.5.255.

**MAC Address**
The format of MAC Address is XX:XX:XX:XX:XX:XX, X means 0~9 or A~F in hex, the A~F are not case sensitive.

**Note**: The MAC address will be changed when it’s a remote device, so it will not be working to filter using MAC for remote devices.

**Action**
Accept: Accept the access from remote hosts.
Drop: Drop the access from remote hosts.
Ignore: Ignore the access.

3) Auto Defense
By default, there is no rule.

<table>
<thead>
<tr>
<th>Add Auto Defense Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port:</td>
</tr>
<tr>
<td>Protocol: UDP</td>
</tr>
<tr>
<td>Rate: 10/min</td>
</tr>
</tbody>
</table>

Figure 5-13 Add Auto Defense Rule

Port
The port you want to auto defense, for example, 8022.

Protocol:
Select the protocol. You can select UDP or TCP.

Rate:
The maximum packets or connections can be handled per unit time.

For example, if you configure it as below:
Port: 8022
Protocol: TCP
Rate: 10/min
Then, it means maximum 10 TCP connections can be handled in 1 minute. The 11th connection will be dropped.
5.2.3 IP Blacklist

You can set some packets accept speed rules here. When a IP address which hasn’t been accepted in common rules sends packets faster than the allowed speed, it will be set as black IP address and blocked automatically.

![IP Blacklist Settings Page](image)

1) Blacklist rules
You can add the rules for IP blacklist rate as you wish.

![Add Blacklist Rule](image)

- **Port**
  Auto defense port

- **Protocol**
  Auto defense protocol. TCP or UDP.

- **IP Packets**
  Allowed IP packets number in the specific time interval.

- **Time interval**
  The time interval to receive IP packets. For example, IP packets “90”, time interval “60” means 90 IP packets are allowed in 60 seconds.

2) IP blacklist
The blocked IP address will display here, you can delete it as you wish.
5.2.4 AMI Settings

The Asterisk Manager Interface (AMI) is a system monitoring and management interface provided by Asterisk. It allows live monitoring of events that occur in the system, as well enabling you to request that Asterisk perform some action. The actions that are available are wide-ranging and include things such as returning status information and originating new calls. Many interesting applications have been developed on top of Asterisk that take advantage of the AMI as their primary interface to Asterisk. There are two main types of messages on the Asterisk Manager Interface: manager events and manager actions. The 3rd party software can work with MyPBX using AMI interface. It is disabled by default. If necessary, you can enable it.

Figure 5-16 AMI Settings

**Username & password:** after enabling AMI, you can use this username and password to log in MyPBX AMI

**IP Restriction:** you can set which IP can log in MyPBX AMI interface

5.2.5 Database Grant

U5XX are using MySQL database from 14.18.0.22. The 3rd party software can access MySQL via internet. Before that, you need to grant the authority to the database user. After entering “Database Grant” page, clicking “Add”, you can add a database user, set user password and grant authority.

Figure 5-17 Database Grant
**Username/password:** The 3rd party can use this username and password to access the MySQL.

**Database:** there are 2 options, CDR and Record. If you choose CDR, then this user has authority to check CDR database; if you choose Record, then the user has authority to check which call has been recorded automatically.

### 5.2.6 Alert Settings

If the device is attacked, the system will notify users the alert via call or E-mail. The attack modes include IP attack and Web Login. For more details on the system security configuration please refer to [APPENDIX B MyPBX Security Configuration Guide](#).

![Alert Settings](image)

**Figure 5-18 Alert Settings**

#### 1. IPATTACK

When the system is attacked by IP address, the firewall will add the IP to auto IP Blacklist and notify the user if it match the protection rule.

1) Phone Notification Settings

- **PHONE Notification**
  Whether enable phone notification.

- **Number**
  The numbers could be set for alert notification; users can setup multiple extension and outbound phone numbers. Please separate them by “;”.
  Example: “500;9911”, if the extension has configured Follow Me Settings, the call would go to the forwarded number directly.

- **Attempts**
  The attempts to dial a phone number when there is no answer.

- **Interval**
  The interval between each attempt to dial the phone number. Must be greater than 3 seconds, the default value is 10 seconds.

- **Prompt**
  Users will hear the prompt while receiving the phone notification.
2) E-mail Notification Settings

**Note**: Please ensure that all voicemail settings are properly configured on the System Settings -> Voicemail Settings page before using this feature.

- **E-mail Notification**
  Whether to enable E-mail Notification or not

- **Recipient’s Name**
  The recipients for the alert notification, and multiple email addresses are allowed, please separate them by “;”. Example: jerry@yeastar.com; jason@yeastar.com, 456@sina.com.

- **Subject**
  The subject of the alert email.

- **Email Content**
  Text content supports predefined variables. Variable names and corresponding instructions are as follows:

  - **$(HOSTNAME)** Host name
  - **$(LOCALIP)** Local IP address
  - **$(SOURCEIP)** Attack source IP address
  - **$(DATETIME)** Occurred
  - **$(USERNAME)** User name (WEBLOGIN effective)
  - **$(DESTMAC)** Attacks destination MAC (IPATTACK effective)
  - **$(DESTPORT)** Attacks destination Port number (IPATTACK effective)
  - **$(PROTOCOL)** Protocol type (IPATTACK effective)
  - **$(INTERFACE)** Network interface name (IPATTACK effective)
2. WEBLOGIN
Web Login Alert Notification: Enter the password incorrectly five times to login MyPBX Web interface will be considered as an attack, the system will limit the IP login within 10 minutes and notify the user.
5.3 LDAP Server

5.3.1 LDAP Server

LDAP is used as a phone book on MyPBX so that you can search a key word from your IP phone. The key word can be a name, a mobile number, an email or other key words in the phonebook.

Note:
It requires that the IP phone should support LDAP feature.

1) LDAP Settings

![Figure 5-21 LDAP Server page](image)

- **Enable LDAP**
  Enable LDAP to use LDAP on your IP phone.

- **Root Node**
  A root node for this LDAP, e.g. dc=pbx, dc=com.

- **PBX Node**
  A pbx node for this LDAP, e.g. ou=pbx, dc=pbx, dc=com.

- **User Name**
  A user for this LDAP, e.g. cn=admin, dc=pbx, dc=com

- **Password**
  A password used to access LDAP.

2) Add Contact
In Add Contact you can create them as required.

![Add Contact](image)

If you want to know how to use LDAP, please refer to Appendix K

### 5.4 Storage Management

#### 5.4.1 Disk Management

You can check the information of the hard disk, manage the disk and do some related configuration. The disk format is EXT3.

- **Device Information**
  It’s the information of the hard disk.

- **Disk Management**
  You can format disk or clean up the disk here.
  Note: Please check if you need to back up these files before formatting or clearing up the hard disk. Don’t power off the device during the period.

- **Other Settings**
  You can:
  a. Save Voicemails in the Disk
  b. Save One Touch Recording Files in the Disk
  c. Save CDR in the Disk

  If you want to enable auto recording, please refer to Appendix J
5.4.2

The External Storage feature is used to extend storage space. Once configured, the files (voicemail, call recording files) created before the configured days will be moved to the Net-Disk.

**Note**: The shared folder must be based on Windows Operation System. And if it's windows Vista/2008/7, please add "Everyone" into the shared account list.
Before external storage can be properly configured, an SMB share folder accessible from MyPBX must be set up on a Windows based machine. Once that has been set up, please follow the steps below.

**Step 1**: Choose a window-based computer that is always in service  
**Step 2**: Create a folder  
**Step 3**: Create a text file named "status.txt" in the folder  
**Step 4**: Share this folder

Then we need input the Net-Disk information in Step2 page.

**Net-Disk Host/IP**: Change this to the IP address of the computer where backup files will be stored.
Net-Disk Share Name: Change this to the name of the shared folder where backups will be stored.

Net-Disk Share Username: The user name used to log into the network share. Leave this blank if it is not required.

Net-Disk Share Password: The password used to log into the network share. Leave this blank if it is not required.

Open your Windows share folder to see if the MyPBX backup files and folders has been created. If the contents of the backup folder look similar to Step3 page, then you have successfully configured external storage on the MyPBX unit.

5.5 System Preferences

In this page, we can set other system preferences, like the password for admin account, system date and time, firmware update, hot standby, backup and restore, reset and reboot.

5.5.1 Password Settings

MyPBX has 3 accounts: admin, user, and cdr. User and cdr account is disabled by default.

Admin account:
The default password for account “admin” is “password”. To change the password, select “admin” in “User”, enter the old password and new password, and click “Save”. The system will then prompt you to re-login using your new password.

After you enter the new password, MyPBX will prompt the password strength. It is recommended that you use numbers, upper-case letters, and lower-case letters to increase the security.
When you log in MyPBX using “admin” account, you can enable “user” and “cdr” account; also, you can change their passwords.

**User account:**
User account is disabled by default and its default password is “password”. When enabling “user” account for the first time, MyPBX will ask you to change “user” password. If you don’t change it, you can’t enable “user” account.
To change the password, select “user” in “User”, enter the old password and new password, and click “Save”. The system will then prompt you to re-login using your new password.
After you enter the new password, MyPBX will prompt the password strength. It is recommended that you use numbers, upper-case letters, and lower-case letters to increase the security.

**CDR account:**
“cdr” account is disabled by default and its default password is “password”. You can enable it after you log in MyPBX using “admin” account.
To change the password, select “cdr” in “User”, enter the old password and new password, and click “Save”. The system will then prompt you to re-login using your new password.
After you enter the new password, MyPBX will prompt the password strength. It is recommended that you use numbers, upper-case letters, and lower-case letters to increase the security.
After enabling "cdr" account, you can log in MyPBX using "cdr". "cdr" account can change its own password.

5.5.2 Date and Time

Set the date and time for MyPBX.

- **Time Zone**
  You can choose your time zone here.

- **Daylight Saving Time**
  Set the mode to Automatic or disabled

- **Automatically Synchronize With an Internet Time Server**
  Input the NTP server so that MyPBX will update the time automatically.

- **Set Date & Time Manually**
  You can set the time to your local right time manually here.
5.5.3 Firmware Update

Upgrading of the firmware is possible through the Administrator Web interface using a TFTP Server or an HTTP URL. Enter your TFTP Server IP address and firmware file name, then click start to update the firmware.

**Notes:**
1. If “Reset configuration to Factory Defaults” is enabled, the system will restore to factory default settings.
2. When update the firmware, please don’t turn off the power. Or the system will get damaged.
3. For more information on the steps of updating the firmware, please refer to this link: http://www.yeastar.com/download/MyPBX-U5XX/MyPBX_U5XX_FirmwareUpgrade_en.pdf

![Figure 5-32 Firmware Update Page](image)

5.5.4 Backup and Restore

We can back up the configurations before resetting MyPBX U5XX to factory defaults, and then restore it using this package. The backup created on MyPBX is encrypted with file format ".bak".

**Notes:**
1. Only configurations, custom prompts will be backed up, the voicemail and recording files are not included.
2. When you have updated the firmware version, it’s not recommended to restore using old package.

![Backup and Restore](image)
Create a New Backup
Users are able to create a new backup for “All” or for separate extensions.

Upload a Backup
Users are able to upload backup for “All” or for separate extensions.

5.5.5 Reset and Reboot

We can reset or reboot MyPBX U5XX via web directly in this page.

Reboot System

Warning: Rebooting the system will terminate all active calls!

Reset to Factory Defaults

Warning: A factory reset will erase all configuration data on the system. Please do not turn off the system until the reset is complete. Any power interruption during this time could cause damage to the system.

Warning: Rebooting the system will terminate all active calls!
**Reset to Factory Defaults**

**Warning**: A factory reset will erase all configuration data on the system. Please do not turn off the system until the RUN light begins blinking. Any power interruption during this time could cause damage to the system.

### 5.5.6 Hot Standby

Redundancy is achieved by using duplicate hardware and software installations and synchronizing data and operating state. Redundancy assures smooth operation even if a system goes down. Essentially a duplicate backup system takes over with virtually no loss of service. This technique assures absolute reliability no matter what failure occurs. In mission critical installations, redundancy is a way to address possibility of any failure.

**Note 1**: Before enabling the Hot Standby feature, please make sure that the two servers in the failover pair are the same model, own the same modules installed in the same slots, the same hardware configurations and firmware version.

**Note 2**: Please configure the primary server first and configure the secondary server only after the running status of primary server becomes “active”.

**Note 3**: The virtual IP address inputted in this page will be the one used for registering in each IP phone.

**Note 4**: Before configuring the Email list in this page, please configure the “voicemail settings” in “PBX → Basic settings”, and make sure the SMTP test successfully.

**Note 5**: Before configuring the SMS list; please make sure the SIM and GSM/UMTS modules are installed well.
Hot Standby

Note 1: Before enabling the Hot Standby feature, please make sure that the two servers in the failover pair are the same model, have the same modules installed in the same slots, the same hardware configurations and firmware version.

Note 2: Please configure the primary server first and configure the secondary server only after the running status of primary server becomes "active".

Step 1: Verify the basic information of the server
Step 2: Configure the IP address and hostname of the primary and secondary servers
Step 3: Configure Hot Standby Settings (example)

<table>
<thead>
<tr>
<th>Basic</th>
<th>Ran-King Status: Disabled&lt;br&gt;Enable: Yes&lt;br&gt;Mode: Primary&lt;br&gt;Secondary Hostname&lt;br&gt;Secondary IP&lt;br&gt;Access Code&lt;br&gt;Virtual IP Address&lt;br&gt;Network Connection Detection</th>
</tr>
</thead>
</table>

Down Notification

| Notification Methods: None<br>Email List<br>SMS List |
|-----------------|--------------------------------------------------|

Advanced

| Heartbeat Options: Keep Alive 2<br>Dead Time: 120<br>Synchronization Options: Disk Synchronization<br>Synchronization Time: Timing Synchronization |
|--------------------------|-----------------------------------------------|

Figure 5-37 Hot Standby Configuration

**Mode:** Primary means the main unit; Secondary means the standby unit;

**Secondary/Primary Hostname:** If this unit mode is primary, then you need to input the hostname of standby unit; vice versa, if this unit is selected as secondary, then the hostname of primary unit is required. In brief, you need to input each other’s host name on this field.

**IP:** You need to input each other’s IP address on this field.

**Access code:** To make an identification number to verify each other. The number must be the same to both units.

**Virtual IP address:** To fill in a virtual IP address includes mask, which is always points to the currently activated unit. Customer can register IP phones through this virtual IP address. Please make sure the virtual IP address netmask is the same on both units but different from their former IP address.

**Network Connection Detection:** Generally it requires the IP address of the router or gateway that connects both units. MyPBX will connect another unit through this IP address.

**Down Notification:** The way of informing customer that the system down.

**Keep Alive:** Every 2 seconds, a package will be sent from one unit to another, which can test whether they are working properly.

**Dead Time:** The default setting is 120 seconds. If there’s no response within 120s after one receiving a package from the other, then the normal working unit will figure the other unit is dead and send an email or SMS to report the failure.

**Disk Synchronization:** It works for synchronizing the data on hard disk only,
such as the call recording files and CDR files saved in disk. The configurations in MyPBX will not be influenced by this feature. 3 options are available: timing synchronization, real-time synchronization and no.
6 PBX

Click to access.

In this page, we can configure the settings of extension, trunk, inbound call control, outbound call control, audio settings and the others. When configured well, we can make calls as scheduled.

6.1 Extensions

In this page, we can configure the extensions’ details and provision the supported models automatically.

6.1.1

There are three types of extensions supported in MyPBX U5XX: SIP, IAX and analog extension.

FXS Extensions

There are two analog extensions in MyPBX U5XX if S2 module is installed. To modify the extension number, please delete it first, then recreate it again.
1) General

![Edit Extension - 601](Image)

**Figure 6-3 Edit FXS Extension**

- **Extension**
The numbered extension, e.g. 1234, that will be associated with this particular User/Phone.

- **Port**
The extension correspond port.

- **Name**
A character-based name for this user, e.g. “Bob Jones”.

- **Caller ID**
The Caller ID (CID) string will be used when this user calls another internal user.

2) Voicemail

- **Enable Voicemail**
Check this box if the user should have a voicemail account.
· **Voicemail Access PIN**
  Voicemail Password for this extension, e.g. “1234”.

3) **Mail Setting**
· **Enable Send Voicemail**
  Once enabled, the voicemail will be sent to the email address below as an attachment.

· **Send Voicemail to Email Address**
  This option defines whether or not voicemails/Fax is sent to the Email address as an attachment.
  **Note**: Please ensure that all voicemail settings are properly configured on the System Settings -> Voicemail Settings page before using this feature.

4) **Flash**
· **Hook Flash Detection**
  Sets the amount of time, in milliseconds, that must pass since the last hook-flash event received by MyPBX before it will recognize a second event. If a second event occurs in less time than defined by Hook Flash Detection, then MyPBX will ignore the event. The default value of Flash is 1000ms, and it can be configured in 1ms increments.

5) **Group**
· **Pickup Group**
  If this extension belongs to a pickup group, any calls that ring this extension can be picked up by other extensions in the same pickup group by dialing the Call Pickup feature code (the default is *4).
  **Note**: *4 is the default setting, it can be changed under Feature Codes -> General -> Call Pickup.

6) **Call Duration Settings**
  Setup the max call duration for every call of this extension, but it’s only valid for outbound calls. Enter “0” or leave this blank empty, the value would be equal to the max call duration configured in the Option Settings page.
  **Note**: This setting will not be valid for internal calls.

**Other Settings**
7) Other options

- **Call Waiting**
  Check this option if the extension should have Call Waiting capability. If this option is checked, the “When busy” follow me options will not be available.

- **DND**
  Don’t Disturb.

- **User Web Interface**
  Check this option to allow the user to login to the MyPBX User Web interface, which can be used to access voicemail and extension recordings. Users may login the MyPBX User Web interface by using their extension number and voicemail PIN as the login and password respectively.

- **Ring Out**
  Check this option if you want to custom the ring time. Tone will stop over the time defined.

8) Follow me (Call Forwarding)
This function sets inbound call forwarding on an extension. An administrator can configure Follow Me for this extension.

9) Volume Settings
Rxgain: The Volume sent to FXS extension.
Txgain: The Volume sent out by the FXS extension

10) Mobility Extension
MyPBX allows you to use your mobile phone as an extension. If you set your mobile phone as a mobility extension and then you call MyPBX with this mobility phone, you will hear a dial tone. MyPBX will recognize your call as a call from an extension. You can dial the number of other extensions (your caller ID will be the number of your extension) or dial out via outbound routes just like dialing from your extension.

**Note:** If callback is enabled in the inbound route, the mobility extension function will be disabled.

- **Enable Mobility Extension**
  Enable this feature.

- **Mobility Extension Number**
  When you dial the server with this number, the mobile phone gets the permission of the extension. For example: dialing the other extensions, playing the voicemail.

- **Ring Simultaneously**
  When the extension has an incoming call, it rings its mobility extension simultaneously.

- **Outbound Prefix**
  Fill in a proper prefix of mobile number so that it can match an outbound route to dial the mobility extension. For example, if you set the prefix to “9”, it will send “9 + mobility extension number” to the outbound route.

11) Call ID type
- **Call ID Setting**
  Normally, you choose the “default” option except for using MyPBX in Japan, in which case you should choose “Japan”.

12) Spy Settings
MyPBX allows extension to monitor/barge in other conversation. Once this feature is enabled, the extension has the ability to monitor/barge in other calls using the feature codes for each spy mode. Refer to “Feature Codes” section for
more information.

· **spy modes**
   There are 4 spy modes available:
   
   General spy: you have the permission to use the following 3 modes.
   
   Normal spy: you can only hear the call, but can't talk
   
   Whisper spy: you can hear the call, and can talk with the monitored extension
   
   Barge spy: you can hear the call and talk with them both

   **Note:** for example, if 500 want to monitor extension 501, we need to enable the “allow being spied” for 501, and choose the spy mode for extension 500.
   
   Then pick up 500 and dial “feature codes + 501” to start monitoring when 501 is in a call.
   
   If 500 choose “normal spy”, it should dial “*90501” to start monitoring.
   
   If 500 choose “whisper spy”, it should dial “*91501” to start monitoring.
   
   If 500 choose “barge spy”, it should dial “*92501” to start monitoring.
   
   If 500 choose “general spy”, it can dial “*90501”, “*91501” or “*92501” to start monitoring.

   **VoIP Extensions**

   A VOIP extension is a SIP/IAX Account that allows an IP Phone or an IP Soft-Phone client to register on MyPBX.

   ![Figure 6-5 VOIP Extension List](image)

   We can click “Add extension” to start.
MyPBX U5 Series Administrator Guide

Figure 6-6 Add/Edit VOIP Extension

1) General
   - **Type**
     Extension type: SIP, IAX or SIP/IAX.
     SIP – The extension sends and receives calls using the VoIP protocol SIP.
     IAX – The extension sends and receives calls using the VoIP protocol IAX.

   - **Extension**
     The numbered extension, e.g. 1234, that will be associated with this particular User/Phone.

   - **Password**
     The password for this extension, but it is not a fixed one. When you add new extension, a random and robust password will be generated like “Gtwfup642”.

   - **Name**
     A character-based name for this user, e.g. “Bob Jones”.

   - **Caller ID**
The Caller ID will be used when this user calls another internal extension.

**Register Name**
It is for extension registration validation. Users will not be able to register the extension if the authorization name is incorrect even though the username and password are correct.

2) Voicemail

**Enable Voicemail**
Check this box if the user should have a voicemail account.

**Voicemail Access PIN**
The voicemail Password for this extension, e.g. “1234”.

3) Mail Setting
This option defines whether or not voicemails or faxes are sent to an Email Address as an attachment.

**Enable Send Voicemail**
Once enabled, the voicemail will be sent to email as an attachment.

**Email Address**
Email address used to receive the voicemail or Fax.

*Note*: Please ensure that the section “SMTP Settings For Voicemail” (in the “Voicemail Settings”) have been properly configured before using this feature.

4) Group

**Pickup Group**
If this extension belongs to a pickup group, any calls that ring this extension can be picked up by other extensions in the same pickup group by dialing the Call Pickup feature code (the default is *4).

*Note*: *4 is the default setting, it can be changed under Feature Codes -> General -> Call Pickup.

5) Call Duration Settings
Setup the max call duration for every call of this extension, but it’s only valid for outbound calls. Enter “0” or leave this blank empty, the value would be equal to the max call duration configured in the Option Settings page.

*Note*: This setting will not be valid for internal calls.

6) VoIP Settings

**NAT**
This setting should be used when the system is using a public IP address to
communicate with devices hidden behind a NAT device (such as a broadband router). If you have one-way audio problems, you usually have problems with your NAT configuration or your firewall’s support of SIP and/or RTP ports.

- **Qualify**
  Send check alive packets to IP phones

- **Enable SRTP**
  Enable extension for SRTP (RTP Encryption).

- **Transport**
  This will be the transport method used by the extension. The options are UDP (default) or TCP or TLS.

- **DTMF Mode** – RFC2833, Info, Inband, Auto.

- **Remote Register**
  Allow to register remote extensions.
  If you enable “Remote Register”, the extension password must include uppercase letters, lowercase letters, and digits.
  This option is used to enhance the system security, it’s disabled by default.
  For more details on the system security configuration, please refer to
  [APPENDIX B MyPBX Security Configuration Guide](#)
7) Other Options

.Call Waiting
Check this option if the extension should have Call Waiting capability. If this option is checked, the “When busy” follow me options will not be available. The call waiting function of IP phone has higher priority than MyPBX’s call waiting function.

.DND
Don’t Disturb. When DND is enabled for an extension, the extension will not be available.

.User Web Interface
Check this option to allow the user to login to the MyPBX User Web interface, which can be used to check voicemail and extension recordings. Users may login MyPBX User Web interface by using their extension number and voicemail PIN as the login and password respectively.
.Ring Out
Check this option if you want to customize the ring time. Ring tone will stop over the time defined.

8) Follow me (Call Forwarding)
Call forwarding for an extension can be configured here. The administrator can configure Follow Me option for this extension. If you want to transfer the call to an outbound number, please follow the dial pattern of outbound route filled in the outbound number.
For example: transferring to your mobile phone number 123456789, the dial pattern of outbound route is “9.”, you should fill in 9123456789 here.

9) IP Restriction
-Enable IP Restriction
Check this option to enhance the VoIP security for MyPBX. If this option is enabled, only the permitted IP/Subnet mask will be able to register this extension number. In this way, the VoIP security will be enhanced.
For more details on the system security configuration, please refer to APPENDIX B MyPBX Security Configuration Guide.

-Permitted “IP address/Subnet mask”
The input format should be "IP address" + "/" + “Subnet mask”.
e.g. "192.168.5.100/255.255.255.255" means only the device whose IP address is 192.168.5.100 is allowed to register this extension number.
e.g. "192.168.5.0/255.255.255.0" means only the device whose IP address is 192.168.5.XXX is allowed to register this extension number.

10) Mobility Extension
MyPBX allows you to use your mobile phone as an extension. If you set your mobile phone as a mobility extension and then you call MyPBX with this mobility phone, you will hear a dial tone. MyPBX will recognize your call as a call from an extension. You can dial the number of other extensions (your caller ID will be the number of your extension) or dial out via outbound routes just like dialing from your extension.

Note: If callback is enabled in the inbound route, the mobility extension function of this inbound route will be disabled.

-Enable Mobility Extension
Enable this feature.

-Mobility Extension Number
When you dial the server with this number, the mobile phone gets the permission of the extension. For example: dialing the other extensions, playing
the voicemail.

- **Ring Simultaneously**
  When the extension has an incoming call, it rings its mobility extension simultaneously.

- **Outbound Prefix**
  Fill in proper a prefix of mobile number so that it can match an outbound route to dial the mobility extension. For example, if you set the prefix to “9”, it will send “9 + mobility extension number” to the outbound route.

11) Spy Settings
MyPBX allows extension to monitor/barge in other conversation. Once this feature is enabled, the extension has the ability to monitor/barge in other calls using the feature codes for each spy mode. Refer to “Feature Codes” section for more information.

- **spy modes**
  There are 4 spy modes available:
  - General spy: you have the permission to use the following 3 modes.
  - Normal spy: you can only hear the call, but can’t talk
  - Whisper spy: you can hear the call, and can talk with the monitored extension
  - Barge spy: you can hear the call and talk with them both

**Note:** for example, if 500 want to monitor extension 501, we need to enable the “allow being spied” for 501, and choose the spy mode for extension 500. Then pick up 500 and dial “feature codes + 501” to start monitoring when 501 is in a call.

If 500 choose “normal spy”, it should dial “*90501” to start monitoring.
If 500 choose “whisper spy”, it should dial “*91501” to start monitoring.
If 500 choose “barge spy”, it should dial “*92501” to start monitoring.
If 500 choose “general spy”, it can dial “*90501”, “*91501” or “*92501” to start monitoring.
6.1.2

The Auto Provision sub menu provides users a method to Auto Provision IP Phone after the Express Setup process.

**Note:** Auto Provision functions fully test with these models:
- **Yealink** (T12, T18, T19, T20, T21, T22, T26, T28, T32, T38, T41, T42, T46, W52P, VP530, VP-2009)
- **Snom** (300, 320, 360, 370)
- **Polycom** (IP 6000, IP 7000, IP 32X, IP33X, IP430, IP450, IP550, IP560, VVX1500)
- **Cisco** (IP7940, IP7960)
- **Aastra** (9480i, 9480i-CT, 6730i, 6731i, 6737i, 6753i, 6755i, 6757i, 6757i CT)
- **GrandStream** (GXP1450, GXP2100, GXP2110, GXP2120)
- **Escene** (ES220, ES320, ES330, ES410, ES620)
- **Fanvil** (C56, C58, C60, C62)
- **Panasonic** (UT113, UT123, UT133, UT136, UT248, UT670, TGP500, TGP550)

**News:**
When provisioning Yealink, Grandstream, Fanvil, Snom IP phone, MyPBX is not needed to be set as the only DHCP server any more.

![Figure 6-8 Phone Provisioning Page](image)

6.1.2.1 General Settings for Yealink
In this page, you can configure the general settings before provisioning Yealink IP phones, including the items like general preferences, codecs, remote phone book and firmware upgrade.

**Note:** if firmware download server is enabled, IP phone will update the firmware automatically according to the version and server you have configured during the provision process.
6.1.2.2 Aastra General Settings
In this page, you can configure the general settings before provisioning Aastra IP phones, including the items like general preferences, program keys configuration, soft keys configuration.

6.1.2.3 Phone book
You can add your contacts here and when you use phone provisioning; the IP phone will download the phone book.
Figure 6-11 Phone Book

1) Add Contact
   - **Type**
     There are three types: None, VIP and Deny list (Blacklist).
   - **Group**
     There are 5 groups: None, Friends, Family, Work, Colleagues list.
   - **Nick Name**
     You can set a nick name for this number.
   - **Favorite**
     Only works with snom phone.
   - **Organization**
     Input the organization of this contact. Only works with snom phone.
   - **Title**
     Input the title of this contact. Only works with snom phone.
   - **Email**
     Input the email of this contact. Only works with snom phone.
   - **Birthday**
     Input the birthday of this contact. Only works with snom phone.
   - **First Name**
     Input the first name of this contact. Only works with snom phone.
   - **Family Name**
     Input the family of this contact. Only works with snom phone.
· **Office Number**
  Input the office number here

· **Mobile Number**
  Input the mobile number here

· **Home Number**
  Input the home number here

· **Sub Number**
  Add sub number of this contact. Only works with snom phone.

· **Note**
  Take some note of this contact. Only works with snom phone.

![Add Contact](image)

*Figure 6-12 Add a Contact*
2) Upload Phonebook
You can upload a phonebook before auto provision, which will be provisioned to the IP phone when using auto provision feature to configure your IP phones. The format of phonebook should be *.xml.

**Note:** All the existing phonebooks of the IP phone will be replaced automatically if the phonebooks are configured in this way.

6.1.2.4 Configure phone
Let's take provisioning Yealink as an example. There are two modes to create new phones: create new phones in webpage and upload the IP Phone’s configuration file.

**Add new phone via webpage**
Click “Add Phone” and fill in the corresponding information in the pop-up window.

![Add Phone](image)

**Figure 6-13 Configure Yealink T28**

1) **General**

- **Enabled**
  Choose yes or no to enable or disable this extension
· **New Config**  
If your IP phone’s firmware version is above x.70.x.x, you should select “Yes”. Or else, it should be “No”.

· **MAC address**  
Input the MAC address of the IP phone

· **Name**  
Put the name of this Phone here.

· **Manufacturer**  
You can choose the Manufacturer of the IP phone

· **Phone Type**  
Choose the model of your phone. Only for snom phone

· **Call Waiting**  
This call feature allows your phone to accept other incoming calls to an extension already in an active call.

· **Key as Send**  
Configure a key as the send key, you can choose #, * or disable this feature.

· **Auto redial**  
Enable or disable auto redial for the IP Phone

· **Auto answer**  
Enable or disable auto answer for the IP phone

· **Phone book**  
Enable or disable the feature of phone book for the IP phone

· **Line**  
You can set each line of IP phone for the account you want, active or not.  
Extension: Selected the extension number for IP Phone.  
Label: It is shown on the LCD for users to identify the account.  
Line Active: You can choose on/off to enable/disable the account respectively.

2) **Codecs**  
In this page, we can set the codecs for the IP phone.
3) Memory key settings
In this page, we can configure the DSS keys of the IP phone one by one.

4) Line keys settings
We can configure the line key settings for this IP phone
6.1.2.4 Not configured phone
In this section, MyPBX will scan all the supported IP phones and display them here. We can click the “MAC address” of an IP phone and input the corresponding information in the pop-up window, like figure 6-13.

6.1.2.5 Upload a file
Click “Upload a file” and choose the configuration file of the IP phone in the popup window.

Note: the file format must be
- Yealink: .cfg file
- Snom: .htm file
- Grandstream: .xml file
Please edit the configuration files in advance before uploading.
6.2 Trunks

6.2.1

Multi physical trunks are supported in MyPBX U5XX, like E1, BRI, PSTN, and GSM/UMTS. There will be 2 E1 ports fixed inside, for other trunks, please make sure you have installed the modules inside, BRI trunk requires B2 module, PSTN trunk requires the O2, while GSM/UMTS trunk needs to install the GSM/UMTS modules inside.

Note:
E1/T1/J1 trunk in MyPBX U5XX

<table>
<thead>
<tr>
<th>E1/T1/J1 Ports</th>
<th>MyPBX U500</th>
<th>MyPBX U510</th>
<th>MyPBX U520</th>
</tr>
</thead>
<tbody>
<tr>
<td>E1/T1/J1 Ports</td>
<td>0</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

E1/T1 trunk

In this page we can configure the details of E1 trunk, before configuring anything, please make sure the cable is fine, and you have got enough information from the ISDN provider.

![E1 Trunk](image)

On the Physical Trunk page, click “Edit“ on the selected trunk and modify its properties in the popup window:
Figure 6-21 Edit E1 Trunk

- **Trunk name**
  Set the trunk name

- **Signaling**
  PRI-NET, PRI-CPE, MFC/R2, SS7

- **Mode Type**
  E1/T1/J1

- **Switch Type**
  - national: National ISDN type2 (common in the US)
  - ni1: National ISDN type 1
  - dms100: Nortel DMS100
  - 4ess: AT&T 4ESS
5ess: Lucent 5ESS  
euroisd: EuroISDN  
qsig: Minimalistic protocol to build a "network" with two or more PBX of different vendors

**Reset interval**
Set the time in seconds between restart of unused channels. Some PBXs don't like channel restarts. So set the interval to a very long interval e.g. 100000000 or "never" to disable entirely. If you are in Israel, the following is important: As Bezeq in Israel doesn't like the B-Channel resets happening on the lines, it is best to set the reset interval to "never" when installing a box in Israel. Our past experience also shows that this parameter may also cause issues on local switches in the UK and China.

**Over Lap Dial**
Define whether MyPBX can dial this switch using overlap digits. If you need Direct Dial-in (DDI; in German "Durchwahl") you should change this to yes, then MyPBX will wait after the last digit it receives.

**PRI Indication**
Tells how Device should indicate Busy() and Congestion() to the switch/user. Accepted values are:
inband: Device plays indication tones without answering; not available on all PRI/BRI subscription lines.
outofband: Device disconnects with busy/congestion information code so the switch will play the indication tones to the caller. Busy() will now do same as setting PRI_CAUSE=17 and Hangup().

**Enable Facility**
To enable transmission of facility-based ISDN supplementary services (such as caller name from CPE over facility).

**NSF**
Used with AT&T PRIs. If outbound calls are being rejected due to "Mandatory information element missing" and the missing IE is 0x20, then you need this setting.

**CRC**
CRC Verification

**Codec**
Default, A-Law, U-Law

**Echo Cancellation**
Disable or enable echo cancellation; it is recommended not to turn this off.

1) Caller ID Prefix

- **ISDN Dialplan**
  These settings are set to make the caller ID prefix work according to information sent from the E1 provider. ISDN telephony numbering plan Recommendation E.164.

- **International Prefix**
  When there are international calls coming in via E1 trunk, the International Prefix you have set here will be added before the CID. So you can know this is an international call before you answer it.

- **National Prefix**
  When there are national calls coming in via this E1 trunk, the National Prefix you have set here will be added before the CID. So you can know this is a national call before you answer it.

- **Local Prefix**
  When there are Local calls coming in via this E1 trunk, the Local Prefix you have set here will be added before the CID. So you can know this is a local call before you answer it.

- **Private Prefix**
  When there are Private calls coming in via this E1 trunk, the Private Prefix you have set here will be added before the CID. So you can know this is a Private call before you answer it.

- **Unknown Prefix**
  When there are calls with unknown number coming via this E1 trunk, the Unknown Prefix you set here will be shown as the caller ID.

2) Dialplan

- **Remote Dialplan**
  Calling number type

- **Remote Number Type**
  Calling number identification

- **Location Dialplan**
  Called number type
• **Location Number Type**
  Called number identification

  **3) DOD Setting**
  DOD (Direct Outward Dialing) means the caller ID displayed when dialing out. Before configuring this, please make sure the provider supports this feature.

  • **Global DOD**
  Global Direct Outward Dialing Number

  • **DOD**
  Direct Outward Dialing Number

  • **Associated Extension**
  The extension making call out via the E1 trunk will display the associated DOD.

  • **Add DOD**
  Add DOD for one associated extension.

  • **Add Bulk DOD**

  ![Add Bulk DOD](image)

  Figure 6-22 Add Bulk DOD

  Add bulk DOD for bulk extensions in ascending sequence with the “Begin DOD” you fill in. For example, if the Associated Extensions are 100, 101, 102, 103, 104, 105 with “Begin DOD” as 5500100, the corresponding DOD will be 5500100, 5500101, 5500102, 5500103, 5500104, and 5500105.

  **BRI Trunk**
Basic Rate Interface (BRI, 2B+D, 2B1D) is an Integrated Services Digital Network (ISDN) configuration intended primarily for use in subscriber lines similar to those that have long been used for plain old telephone service. The BRI configuration provides 2 bearer channels (B channels) at 64 kbit/s each and 1 data channel (D channel) at 16 kbit/s. The B channels are used for voice or user data, and the D channel is used for any combination of data, control/signalling, and X.25 packet networking.

Figure 6-23 BRI Trunk

Click edit to configure the details of BRI trunks.
**Figure 6-24 Edit BRI Trunk**

- **Trunk Name**
  A unique label used to identify this trunk when listed in outbound rules, incoming rules, etc. E.g. "BriTrunk1".

- **Signaling**
  Signaling method
  - BRI-CPE: ISDN BRI in TE mode and Point to Point.
  - BRI-CPE-PTMP: ISDN BRI in TE mode and Point to multi Point.
  - BRI-NET: ISDN BRI in NET mode and Point to Point.
  - BRI-NET-PTMP: ISDN BRI in NET mode and Point to multi Point.

- **Switch Type**
  - National: National ISDN type2 (common in the US)
  - ni1: National ISDN type 1
  - dms100: Nortel DMS100
  - 4ess: AT&T 4ESS
  - 5ess: Lucent 5ESS
  - euroisdn: EuroISDN
  - qsig: D-channel signaling protocol at Q reference point for PBX networking.

- **Over Lap Dial**
  Define whether MyPBX can dial this switch using overlap digits or not. If you need Direct Dial-in (DDI; in German "Durchwahl") you should change this to yes, then MyPBX will wait after the last digit it receives.

- **Reset interval**
  Set the time in seconds between restart of unused channels. Some PBXs don't like channel restarts. so set the interval to a very long interval e.g. 100000000 or "never" to disable entirely. If you are in Israel, the following is important: As Bezeq in Israel doesn't like the B-Channel resets happening on the lines, it is best to set the reset interval to "never" when installing a box in Israel. Our past experience also shows that this parameter may also cause issues on local switches in the UK and China.

- **PRI Indication**
  Tells how Device should indicate Busy() and Congestion() to the switch/user. Accepted values are:
  - inband: Device plays indication tones without answering; not available on all PRI/BRI subscription lines
  - outofband: Device disconnects with busy/congestion information code so the switch will play the indication tones to the caller. Busy() will now do same as setting PRI_CAUSE=17 and Hangup().
- **Enable Facility**  
  To enable transmission of facility-based ISDN supplementary services (such as caller name from CPE over facility).

- **NSF**  
  Used with AT&T PRIs. If outbound calls are being rejected due to "Mandatory information element missing" and the missing IE is 0x20, then you need this setting.

- **Echo Cancellation**  
  Disables or enables echo cancellation; it is recommended not to turn this off.

- **Hide Caller ID**  
  If you want others to see your CID, please disable this option.

- **Codec**  
  You can choose alaw or ulaw.

1) Caller ID Prefix

- **ISDN Dialplan**  
  These settings are set to make the caller ID prefix work according to information sent from the E1 provider. ISDN telephony numbering plan Recommendation E.164.

- **International Prefix**  
  When there are international calls coming in via this BRI trunk, the International Prefix you have set here will be added before the CID. So you can know this is an international call before you answer it.

- **National Prefix**  
  When there are national calls coming in via this BRI trunk, the National Prefix you have set here will be added before the CID. So you can know this is a national call before you answer it.

- **Local Prefix**  
  When there are Local calls coming in via this BRI trunk, the Local Prefix you have set here will be added before the CID. So you can know this is a local call before you answer it.

- **Private Prefix**  
  When there are Private calls coming in via this BRI trunk, the Private Prefix you have set here will be added before the CID. So you can know this is a Private call before you answer it.
· **Unknown Prefix**
When there are calls with unknown number coming via this BRI trunk, the Unknown Prefix you set here will be shown as the caller ID.

2) Dialplan

· **Remote Dialplan**
Calling number type

· **Remote Number Type**
Calling number identification

· **Location Dialplan**
Called number type

· **Location Number Type**
Called number identification

3) DOD Setting

· **Global DOD**
Global Direct Outward Dialing Number

· **DOD**
Direct Outward Dialing Number.

· **Associated Extension**
The extension making call out via BRI Trunk will display the associated DOD.

· **Add DOD**
Add DOD for one associated extension.

· **Add Bulk DOD**
Add bulk DOD for bulk extensions in ascending sequence with the “Begin DOD” you fill in. For example, if the Associated Extensions are 100, 101, 102, 103, 104, 105 with “Begin DOD” as 5500100, the corresponding DOD will be 5500100, 5500101, 5500102, 5500103, 5500104, and 5500105.

PSTN trunk

The public switched telephone network (PSTN) is the network of the world's public circuit-switched telephone networks.

Click edit to configure more details.
Figure 6-27 Edit PSTN Trunk

**Trunk Name**
A unique label used to identify this trunk when listed in outbound rules, incoming rules, etc. E.g. “pstn5”.

**Volume Setting**
Used to modify the volume level of this trunk. Normally, this setting does not need to be changed.

1) **Hangup Detection**
2) **Busy Detection**
   Busy Detection is used to detect far end hang-up or for detecting a busy signal. Select “Yes” to turn this feature on.

3) **Busy Count**
   If Busy Detection is enabled, it is also possible to specify how many busy tones to wait for before disconnecting the call. The default is 4, but better results can be achieved if set to 6 or even 8. Remember, the higher the number, the more time will be required to release a channel. A higher setting lowers the probability that you will encounter random hang-ups.
· **Busy Interval**
The busy detection interval

· **Busy Pattern**
If Busy Detection is enabled, it is also possible to specify the cadence of your busy signal. In many Countries, it is 500msec on, 500msec off. Without Busy Pattern specified, MyPBX will accept any regular sound-silence pattern that repeats <Busy Count> times as a busy signal. If you specify Busy Pattern, then MyPBX will further check the length of the tone and silence, which will further reduce the chance of a false positive disconnection.

· **Frequency Detection**
Used for Frequency Detection (Enable detecting the busy signal frequency or not).

· **Busy Frequency**
If the Frequency Detection is enabled, you must specify the local frequency.

· **Hangup Polarity Reversal Detection**
The call will be considered as “hang up” on a polarity reversal.

2) **Answer Detection**

· **Answer Detection**
Answer Detection settings are configured for accurate billing. If the PSTN trunk sends polarity after answering the call, users can choose "Polarity Detection"; or else choose "Ring Detection", and configure the detailed settings according to the PSTN line ring tone.

3) **Caller ID setting**

· **Caller ID Start**
This option allows you to define the start of a Caller ID signal:
Ring: Start when a ring is received (Caller ID Signaling: Bell_USA, DTMF).
Polarity: Start when a polarity reversal is started (Caller ID Signaling: V23_UK, V23_JP, DTMF).
Before Ring: Start before a ring is received (Caller ID Signaling: DTMF).

· **Caller ID Signaling**
This option defines the type of Caller ID signaling to use. It can be set to one of the following:
Bell: bell202 as used in the United States
v23_UK: suitable in the UK
v23_Japan: suitable in Japan
v23-Japan pure: suitable in Japan
DTMF: suitable in Denmark, Sweden, and Holland

**Caller ID Detection**
For FXO trunks, this option forces MyPBX to clarify Caller ID incoming calls.

**GSM/UMTS Trunk**
GSM/UMTS trunks are supported in MyPBX U5XX if you have got the GSM/UMTS module and SIM cards installed. One GSM/UMTS trunk supports only one SIM card for one concurrent call.

![GSM/UMTS Trunk](image)

Click edit to configure more details.

![Edit GSM/UMTS Trunk](image)

**Trunk Name**
A unique label used to identify this trunk when listed in outbound rules, incoming rules, etc. E.g. “GSM9”.

**Volume Setting**
Used to modify the volume level of this trunk. Normally, this setting does not need to be changed.

**PIN Code**
Please enter your SIM card PIN code here if your card has a Pin code.

**6.2.2**
There are two types of VOIP trunk in MyPBX: SIP and IAX, in this page, we can
also configure the “Service Provider” trunk, which doesn’t need the use name and password for authorization, when you have bought a trunk from provide with IP address only, please choose “Service Provider” trunk.

![Figure 6-30 VOIP Trunk]

### 6.2.2.1 VoIP Trunk

In this page, we can configure VoIP trunk (SIP/ IAX) you have got from provider with the authorization name and password.

![Figure 6-31 VOIP Trunk]

1) **Add VoIP Trunk**

Input the correct SIP information (provided by VoIP provider). Inaccurate information will prevent the trunk from registering. You can delete multiple trunks at once as required.
Figure 6-32 Add a SIP Trunk

- **Type**
  SIP – Identifies whether the trunk sends and receives calls using the VoIP protocol SIP

- **Provider Name**
  A unique label to help you identify this trunk when listed in outbound rules, incoming rules etc. E.g. “yeastar”.

- **Hostname/IP**
  Service provider’s hostname or IP address. 5060 is the standard port number used by SIP protocol. Don’t change this part if it is not required.

- **Domain**
  VoIP provider’s server domain name.
· **Username**  
Username of the SIP account. Used for SIP trunk registration.

· **Authorization name**  
Used for SIP authentication. Leave this blank if not required.

· **Password**  
Password of the SIP account.

· **From User**  
All outgoing calls from this SIP Trunk will use the From User (In this case the account name for SIP Registration) in From Header of the SIP Invite package. Keep this field blank if not needed.

· **Online number**  
Define the online number that expected by “Skype Connect“ and some other SIP service providers. Leave this field blank if not needed.

· **Maximum Channels**  
Control the maximum number of outbound channels (simultaneous calls) that can be used on this trunk. Inbound calls are not counted against the maximum. Set as 0 to specify no maximum.

· **Caller ID**  
Specify the caller ID to use when making outbound calls over this trunk. The caller ID set in the "Extension“ page will override the caller ID set in the "VOIP trunk“ page. Please note that not all the service providers support this feature. Contact your service provider for more information.

· **Outbound Proxy Server**  
A proxy that receives requests from a client. Even though it may not be the server resolved by the Request-URI.

· **Realm**  
Realm is a string to be displayed to users so they know which username and password to use.

· **Codecs**  
Define the codec for this sip trunk and its priority  
**Note:** To change the codec type and priority of this trunk, please create it first, it will appear when you edit it again.

· **Transport**
This will be the transport method used by the SIP Trunk. This method is given by the SIP trunk provider. The options are UDP (default) or TCP or TLS.

- **Enable SRTP**
  Define if SRTP is enabled for this trunk.

- **Qualify**
  Send check alive packets to the sip provider.

- **DTMF mode**
  Set default mode for sending DTMF of this trunk. Default setting: rfc2833

- **DOD**
  DOD (Direct Outward Dialing) means the caller ID displayed when dialing out. Before configuring this, please make sure the provider supports this feature.

- **Associated Extension**
  The extension making call out via SIP Trunk will display the associated DOD.

- **Add DOD**
  Add DOD for one associated extension.

- **Add Bulk DOD**

  ![Add Bulk DOD](image)

  Figure 6-33 Add a SIP Trunk

  Add bulk DOD for bulk extensions in ascending sequence with the “Begin DOD” you fill in. For example, if the Associated Extensions are 100, 101, 102, 103, 104, 105 with “Begin DOD” as 5500100, the corresponding DOD will be 5500100, 5500101, 5500102, 5500103, 5500104, and 5500105.
2) **Add IAX trunk**

Input the correct IAX information (provided by VOIP provider). Inaccurate information will prevent the trunk from registering.

![Add VoIP trunk](image)

**Type**

IAX – Identifies whether the trunk sends and receives calls by using the VoIP protocol IAX.

**Provider Name**

A unique label to help you identify this trunk when listed in outbound rules, incoming rules etc. E.g. “yeastar2”

**Hostname/IP**

Service provider’s hostname or IP address. 4569 is the standard port number used by IAX protocol. Don’t change this part if it is not required.

**Username**

Username of IAX account; Used for IAX trunk registration.

**Password**

Password of IAX account
**Online number**
Define the online number that expected by “Skype Connect” and some other SIP service providers. Leave this field blank if it’s no required.

**Maximum Channels**
Control the maximum number of outbound channels (simultaneous calls) that can be used on this trunk. Inbound calls are not counted against the maximum. Set as 0 to specify no maximum.

**Caller ID**
Specify the caller ID to use when making outbound calls over this trunk. The caller ID set in the “extension” page will override the caller ID setting in the “VOIP trunk” page. Please note that not all the service providers support this feature. Contact your service provider for more information.

**DOD**
DOD (Direct Outward Dialing) means the caller ID displayed when dialing out. Before configuring this, please make sure the provider supports this feature.

**Associated Extension**
The extension make call out via IAX Trunk will display the associated DOD.

**Add DOD**
Add DOD for one associated extension.

**Add Bulk DOD**

![Figure 6-35 Add Bulk DOD](image)
Add bulk DOD for bulk extensions in ascending sequence with the “Begin DOD” you fill in. For example, if the Associated Extensions are 100, 101, 102, 103, 104, 105 with “Begin DOD” as 5500100, the corresponding DOD will be 5500100, 5500101, 5500102, 5500103, 5500104, and 5500105.

6.2.2.2 Service Provider

In this page, we can configure Service Provider. You can add Service Provider as required. And also you can delete multiple trunks at once by ticking the checkbox as required.

Figure 6-36 Service Provider page

Below is a Service Provider trunk (peer to peer mode), which authorize using IP address only. If you have got a trunk with IP address only, please choose this type.

Figure 6-37 Service Provider Trunk
- **Type**
  SIP or IAX
  SIP – Identifies whether the trunk sends and receives calls by using the VoIP protocol SIP.
  IAX – Identifies whether the trunk sends and receives calls by using the VoIP protocol IAX.

- **Provider Name**
  A unique label would help to you identify this trunk. E.g. “Provider2”.

- **Hostname/IP**
  Service provider’s hostname or IP address.
  **Note:** 5060 is the standard port number used by SIP protocol, 4569 is the standard port number used by IAX protocol. Don’t change this part if it is not required.

- **Maximum Channels**
  Control the maximum number of outbound channels (simultaneous calls) that can be used on this trunk. Inbound calls are not counted against the maximum. Leave blank to specify no maximum.

- **Codecs**
  Define the codec for this sip trunk and its priority
  **Note:** codec can only display when editing it after creating the trunk.

- **Transport**
  This will be the transport method used by the SIP Trunk. This method is given by the SIP trunk provider. The options are UDP (default) or TCP or TLS.

- **Qualify**
  Send check alive packets to the sip provider.

- **DTMF mode**
  Set default mode for sending DTMF of this trunk. Default setting: rfc2833

- **DOD**
  DOD (Direct Outward Dialing) means the caller ID displayed when dialing out. Before configuring this, please make sure the provider supports this feature.

- **Associated Extension**
  The extension making call out via this trunk will display the associated DOD.
- **Add DOD**
  Add DOD for one associated extension.

- **Add Bulk DOD**

  ![Add Bulk DOD](image)

  Figure 6-38 Add Bulk DOD

  Add bulk DOD for bulk extensions in ascending sequence with the “Begin DOD” you fill in. For example, if the Associated Extensions are 100, 101, 102, 103, 104, 105 with “Begin DOD“ as 5500100, the corresponding DOD will be 5500100, 5500101, 5500102, 5500103, 5500104, and 5500105.

### 6.3 Outbound Call Control

#### 6.3.1 Outbound Routes

In this page, we can configure the outbound rules to control the outgoing calls.

**Notes:**

1. The max number of outbound route is 64.
2. If the dial patterns are the same in several routes, MyPBX will choose the available routes from top to the last one.
3. When you have created a new extension, please edit the outbound route so that it can dial out too.

![Outbound Routes](image)

Figure 6-39 Outbound Route Page
We can create outbound route or use the default route “pstnout” (dial 9+ numbers to dial out). Also you can delete multiple outbound routes at once as required.

**Figure 6-40 Add/Edit Outbound Route**

- **Route Name**
  Name of this Outbound Route. E.g. “Local” or “Long Distance”.

- **Password**
  The route password can be used to protect this route from being accessed without a password. You can choose one of the passwords in the PIN list that you can click the “PIN Settings” to edit it in “PIN Settings” page.
· **T.38 Support:**
Enable T38 fax in this outbound route (Only for SIP Trunk).

· **Rrmemory Hunt**
Round robin with memory remembers which trunk was used last time, and then uses the next available trunk to call out.

· **Office Hours**
When a specific office hour is selected, this outbound route can only be used during this office hour, and can’t be used in non-office hours.

· **Dial Pattern**
Outbound calls that match this dial pattern will use this outbound route. There are a number of dial pattern characters that have special meanings:
- **X:** Any Digit from 0-9
- **Z:** Any Digit from 1-9
- **N:** Any Digit from 2-9
- **[12345-9]:** Any digit in the brackets (in this example, 1, 2, 3, 4, 5, 6, 7, 8, 9)
The “." Character will match any remaining digits. For example, “9011.” will match any phone number that starts with “9011”, excluding “9011” itself.
The “!” will match none remaining digits, and causes the matching process to complete as soon as it can be determined that no other matches are possible.

Example 1: **NXXXXXX** will match any 7-digit phone number.
Example 2: **1NXXNXXXXX** will match a phone number starting with a 1, followed by a 3-digit area code, and then 6-digit number.

· **Strip**
Allows the user to specify the number of digits that will be stripped from the front of the phone number before the call is placed. For example, if users must press 0 before dialing a phone number, one digit should be stripped from the dial string before the call is placed.

· **Prepend**
These digits will be prepended to the phone number before the call is placed. For example, if a trunk requires 10-digit dialing, but users are more comfortable with 7-digit dialing, this field could be used to prepend a 3-digit area code to all 7-digit phone numbers before calls are placed.

· **Add**
Add multiple dial patterns in this outbound route.

· **Member Extensions**
Define the extensions that will be permitted to use this outbound route.
**Member Trunks**
Define the trunks that can be used for this outbound route.

### 6.3.2 Speed Dial Settings

**1) Options**
- **The prefix of speed dial**
  The prefix should be dialed before the speed dial number. The default is *99.

**2) Add new speed dial.**
- **Source Number**
  The speed dial number.

- **Destination Number**
  The number you want to call.

  E.g. the source number is "123". The destination number is 5503305. The prefix number is *99. You can use an extension with any type to dial *99123, then it will call the number 5503305.

**Note:** Don’t forget to add the outbound dial prefix if you would like to dial the speed dial number through trunk.
6.4 Inbound Call Control

In this page, we can configure the details of IVR, ring group, queue and inbound routes.

6.4.1

When there’s an inbound call aims at Auto Attendant, MyPBX will play an IVR recording and route the caller to the requested destination (for example, “Welcome to XX company, for sales press 1, for technical support press 2, for operator press 0”, etc). The system will transfer the call to corresponding extension according to DTMF digits input by the user.

There is a default IVR here, we can edit it directly or add IVR by yourself.
Figure 6-44 IVR Settings

- **Number**
  MyPBX treats IVR as an extension; you can dial this extension number to reach the IVR from internal extensions.

- **Name**
  A name for the IVR

- **Prompt**
  The prompt recording that will be played when this IVR is reached.

- **Repeat Count**
  The number of times that the selected IVR prompt will be played.

- **Key Timeout**
  Wait for the user to enter a new extension for a specified number of seconds.
·Enable Direct Dial
Allow the caller to dial other extensions number directly.

·Key Press Events
A list of actions that can be performed depending on the digit dialed by the user.

·Key
The Key pressed when the callers hear the IVR prompt.

·Action
When the callers press the corresponding key, the action that MyPBX will execute.
No Action: Do nothing
Connect to Extension: connect the call to an extension.
Connect to Voicemail: connect the call to the voicemail of an extension.
Connect to RingGroup: connect the call to a ringgroup.
Connect to IVR: connect the call to an IVR.
Connect to Conference Room: connect the call to a conference room.
Connect to DISA: connect the call to a DISA.
Connect to Queue: connect the call to a queue.
Connect to Faxes: connect the call to Faxes of extensions.
Dial by Name: the callers can dial the name of an extension to connect to the corresponding extension.
Hung up: hang up the call.

·Destination
Where will MyPBX route the call when the action occurs.

·Time Out
Define the timeout action. A timeout occurs after the IVR prompt has finished playing for the number of times specified by the “Repeat Count” field.

·Invalid
Define the invalid action. The invalid action is triggered if the user enters a DTMF digit that is not defined for this IVR.

6.4.2
Ring groups can be configured to balance the call traffic for multiple users and give callers a higher level of availability for incoming calls. Multiple ring methods and voicemail are supported.
Note: follow me feature in extension page will not take effect when it’s ringing
as an agent.

There is a default ring group, you can edit it or create a new one.

- **Ring Group Name**
  This option defines a name for this group, e.g. “Sales”. "Ring Group Name” is a label to help you identify this group in the group list.

- **Ring Group Number**
  This option defines the numbered extension that can be dialed to reach this group.
**Strategy**
This option sets the Ringing Strategy for this Group. The options are as follows:
1. Ring All Simultaneously: Ring all available extensions simultaneously.
2. Ring Sequentially: Ring each extension in the group one at a time.

**Mobility Extension Rings Simultaneously**
If set to yes, when the extension in the Ring group is called, the associated mobility extension will ring simultaneously. Beforehand, the option of “Rings Simultaneously” should be ticked in the extension settings.

**Seconds to ring each member**
1. If the strategy is “Ring All Simultaneously”, it means the number of seconds to ring this group before routing the call according to the “Destination if No Answer” settings.
2. If the strategy is “Ring Sequentially”, it means the number of seconds to ring a single extension before moving on to the next one.

**Ring Group Members**
An extension can be made a member of this ring group by moving it into the “Selected” box.

**Destination If No Answer**
When all members on this group fail to answer the call, system will handle the call according to the selected destination.

### 6.4.3 Queues
Call Queues give users (e.g. call centers) an efficient means to have their calls answered in the order they were received to deliver top tier customer service.

Call queues allow calls to be sequenced to one or more agents.

**Notes:**
1. Dial “Queue number + ’*’” to log in or “Queue number + ’**’” to log out the queue. For example, if the queue number is “680”, then agent can dial “680*” to log in or “680**” to log out.
2. Follow me feature in extension page will not take effect when it’s ringing as an agent of queue.

![Figure 6-48 Add/Edit Queue](image)
· **Queue Name**  
  A name for the Queue.

· **Queue Number**  
  Use this number to dial into the queue, or transfer callers to this number to put them into the queue.

· **Queue Password**  
  You can require agents to enter a password before they can login to this queue.

· **Queue Agent Timeout**  
  The number of seconds an agent's phone can ring before we consider it a timeout.

· **Queue Max Wait Time**  
  The maximum number of seconds a caller can wait in a queue before being pulled out. (0 for unlimited).

· **Queue Ring Strategy**  
  This option sets the Ringing Strategy for this Queue. The options are  
  - RingAll: ring all available Agents simultaneously until one answers.  
  - LeastRecent: ring the Agent which was least recently called.  
  - FewestCalls: ring the Agent with the fewest completed calls.  
  - Random: ring a random Agent.  
  - RRmemory: Round Robin with Memory, Remembers where it left off in the last ring pass.

1)  **Agents**  
   This selection shows all users. Selecting a user here makes them an agent of the current queue.

2)  **Caller Position Announcements**  
    · **Announce Position**  
      Announce position of caller in the queue

    · **Announce Hold Time**  
      Enabling this option causes MyPBX to announce the hold time to the caller periodically based on the frequency timer. Either yes or no; hold time will not be announced if <1 minute.

    · **Frequency**  
      How often to announce queue position and estimated hold time.  
      **Note:** “0 seconds” means disabling the announcement.  

3)  **Periodic Announcements**
· **Prompt**  
Select a prompt file to play periodically.

· **Frequency**  
How often to announce a prompt to the caller.

4) **Events**  
If a caller presses the key while waiting in the queue, this setting selects which action should process the key press.

5) **Failover-Destination**  
Define the failover action. A failover occurs after the user reach the Queue max wait time.

6) **Others**
   · **Music On Hold**  
Select the "Music on Hold" Class for this Queue.
   
   · **Leave When Empty**  
This option controls whether callers already on hold are forced out of a queue that has no agents. There are two options.  
   Yes: Callers are forced out of a queue when no agents are logged in.  
   No: Callers will remain in a queue with no agents.

   · **Join Empty**  
This option controls whether callers can join a call queue that has no agents. There are two options,  
   Yes: Callers can join a call queue with no agents or only unavailable agents  
   No: Callers cannot join a queue with no agents  
The default option is No.

   · **Agent Announcement**  
Announcement played to the Agent prior to bridging in the caller.

   · **Join Announcement**  
Announcement played to callers once prior to joining the queue.

   · **Retry**  
The number of seconds we wait before trying all the phones again.

   · **Wrap-up time**  
How many seconds after the completion of a call an Agent will have before the Queue can ring them with a new call. The default is 30.
6.4.4

Conference Calls increase employee efficiency and productivity, and provide a more cost-effective way to hold meetings. Conference agents can dial * to access to the settings options and the admin can kick the last user out and can lock the conference room.

- **Extension**
  This is the number dialed to reach this Conference Room.

- **Admin**
  Admin can kick a user out and can lock the conference room.

- **PIN**
  Set a PIN that must be entered in order to access this conference room (e.g. 1234).
6.4.5

Inbound routing processes incoming call traffic to destination extensions during office hours or outside office hours.

There is a default inbound route for all the trunks and set IVR as the destination, you can edit it or create a new one for your demands or you can delete multiple outbound routes at once as required. When an incoming call arrives, the system will first check “fax detection”, then “Holidays”, at last “Business Days”.

Figure 6-51 Inbound Route List

Figure 6-52 Add/Edit Inbound Route
1) General
   - **Route Name**
     A name for this inbound route. E.g.“pstnin”.

   - **DID Number**
     Define the expected DID Number if this trunk passes DID on incoming calls. Leave this field blank to match calls with any or no DID info. You can also use pattern matching to match a range of numbers. The following patterns may be used:
     - **X**: Any Digit from 0-9
     - **Z**: Any Digit from 1-9
     - **N**: Any Digit from 2-9
     - **[12345-9]**: Any digit in the brackets (in this example, 1, 2, 3, 4, 5, 6, 7, 8, 9)
     The “.” Character will match any remaining digits. For example, “9011.” will match any phone number that starts with 9011, excluding 9011 itself. The “!” will match none remaining digits, and causes the matching process to complete as soon as it can be determined that no other matches are possible.

     Example 1: **NXXXXXX** will match any 7-digit phone number.
     Example 2: **1NXXNXXXXX** will match a phone number starting with a 1, followed by a 3-digit area code, and then 6-digit number.

     For more information, please refer to [Appendix H How to Use DID](#).

   - **Extension**
     Define the extension for DID number. This field is only valid when you use BRI, SIP, SPS or SPX trunk for this inbound router. You can only input number and “-” in this field, and the format can be xxx or xxx-xxx. The count of the number must be only one or equal the count of the DID number.

   - **Caller ID Number**
     Define the Caller ID Number to be matched on incoming calls. Leave this field blank to match any or no DID info. You can also use a pattern match (e.g. 2[345]X) to match a range of numbers. The following patterns may be used:
     - **X**: Any Digit from 0-9
     - **Z**: Any Digit from 1-9
     - **N**: Any Digit from 2-9
     - **[12345-9]**: Any digit in the brackets (in this example, 1, 2, 3, 4, 5, 6, 7, 8, 9)
     The “.” Character will match any remaining digits. For example, “9011.” will match any phone number that starts with “9011”, excluding “9011” itself. The “!” will match none remaining digits, and causes the matching process to complete as soon as it can be determined that no other matches are possible.
Example 1: `NXXXXXX` will match any 7-digit phone number.
Example 2: `1NXXNXXXXX` will match a phone number starting with a 1, followed by a 3-digit area code, and then 6-digit number.

**Distinctive Ringtone**
MyPBX supports mapping to custom ring tone files. For example, if you configure the distinctive ringing for custom ring tone to “Family”, the ring tone will be played if the phone receives the incoming call.

**Enable Callback**
You can enable the callback function of this inbound route. If you want to configure the callback function, please refer to chapter 6.7.4

How do I configure distinctive ring tones? Please refer to APPENDIX F. Currently distinctive ringtone can be compatible with Yealink and snom phone.

2) Member Trunks
This area allows you to select which trunks will be member trunks for this route. To make a trunk a member of this route, please move it to the “Selected” box.

3) Business Days
Define where the calls will be routed during Business Days.

**Office Hours**
Select one defined business days office hours.

**Office Hours Destination**
Configure where to route the incoming calls during office hours.

- End Calls
Route the incoming calls to end calls, the system will auto hang up the call.

- Extension
Route the incoming calls to a specific extension.

- Voicemail
Route the incoming calls to an extension’s voicemail.

- IVR
Route the incoming calls to a specific IVR.

- Ring Group
Route the incoming calls to a specific Ring Group.
- **Conference Room**
  Route the incoming calls to a specific Conference Room.

- **DISA**
  Route the incoming calls to a specific DISA.

- **Queues**
  Route the incoming calls to a specific Queue.

- **Faxes**
  Route the incoming faxes to a specific extension’s mail address.
  Note: This function only supports T.38 faxes.

- **Outbound Routes**
  Route the incoming calls to a specific outbound route.

This function is mainly used for the connection of two branches.
For example: Company A locates headquarters in the USA with a branch B in China. A and B both have MyPBX phone systems.
Now if staff of A would like to make a call to a telephone or mobile phone in China from the extension of A but via the FXS line of B, that can be done by this configuration.

- **Non-office Hours Destination**
  Configure where to route the incoming calls during non-office hours.

4) **During Holidays**
Define where the calls will be routed during Holidays.

- **Holiday**
  Select which defined Holiday to use. When a time is defined in both Business Days and Holidays, it will be treated as Holidays.

- **Destination**
  Configure where to route the incoming calls during holidays.

5) **Fax Detection**
Configure if detecting faxes in this inbound route.

**Note:** Please choose IVR as the destination above before configuring fax detection (recommended).

- **Destination**
  Configure where the faxes will be routed when faxes are detected.
- **No detect**
  Do not detect faxes.

- **Custom Email**
  Customize an E-mail address to receive the faxes. You should first configure the "Voicemail Settings->SMTP Settings for Voicemail" correctly before you use this option.

- **Faxes**
  Send faxes to an extension. If choosing a FXS extension here, the fax will be sent to the FXS port selected, you should connect a fax machine to this FXS port. If choosing a VoIP extension, the fax will be sent to the extension’s voicemail as an attachment.

**Note:** If you want to receive faxes with custom Email address, the “SMTP Settings” of “Voicemail Settings” should be configured successfully in advance. If you want to receive faxes with E-mail address configured in VOIP extension voicemail, you should first make sure the tested email to your email address works fine.
6.5 Audio Settings

Custom prompts are supported in MyPBX, and you can change the system prompts to your local country’s prompt.

6.5.1

We can record or upload the prompts in this page; you can also play it directly to confirm if it’s a valid one, you can also download it and save it as a backup.

![Custom Prompts List](image)

**1. Record new Prompt**

The administrator can record custom prompts by doing the following:
1) Click “Record New Custom Prompt”.
2) Input the desired file name on the popup window and choose an extension to call for recording (such as 500).
3) Click “Record”. The selected extension will ring and you can pick up the phone to start recording.

**2. Upload Prompt**
The administrator can also upload prompts by doing the following:
1) Click “Upload Prompt”.
2) Click “Browse” to choose the desired prompt.
3) Click “Upload” to upload the selected prompt.

**Note:** The file size must not be larger than 1.8 MB, and the file must be WAV format:
- GSM 6.10 8 kHz, Mono, 1 Kb/s;
- Alaw/Ulaw 8 kHz, Mono, 1 Kb/s;
- PCM 8 kHz, Mono, 16 Kb/s.

### 6.5.2

In this page, we can upload the music on hold prompts.

The administrator can upload on hold music as follows:
1) Click “Upload Music on Prompt”.
2) Click “Browse” to choose the desired audio file.
3) Click “Upload” to upload the selected file.
Figure 6-57 Upload Music on Hold

**Note:** The file size must not be larger than 1.8 MB, and the file must be WAV format:
- GSM 6.10 8 kHz, Mono, 1 Kb/s;
- Alaw/Ulaw 8 kHz, Mono, 1 Kb/s;
- PCM 8 kHz, Mono, 16 Kb/s.

### 6.5.3 System Prompts Settings

MyPBX have prompts of many languages. You can download the appropriate language you need. MyPBX can support American English, Australian English, Chinese, Dutch, French, Canadian French, German, Greek, Hungarian, Italian, Polish, Portuguese, Brazilian Portuguese, Russian, Spanish, Mexican Spanish, Turkish, Thai, and Korean currently.

**Notes:**
1. Auto-detection is highly recommended. But if you prefer to download via HTTP or TFTP server, please contact the local dealer for the prompts.
2. When update successfully, just click “Apply Changes” on Web then it will take effect, there is no need to reboot.

Figure 6-58 System Prompts Settings Page
6.6 Basic Settings

There are some basic settings we need to configure MyPBX U5XX, like the General Preferences, Business Hours, Feature Codes, and Voicemail Settings.

6.6.1

In this page, there are some general settings of MyPBX.

![General Preferences](image)

Figure 6-59 General Settings

1) General

- **Ring Timeout**
  Number of seconds to ring a device before handling the call as per the extension’s Follow Me settings. The default value is 30s.

- **MAX call duration**
  The absolute maximum amount of time permitted for a call. A setting of 0 disables the timeout. The default value is 6000s.

- **Maximum concurrent calls**
Maximum concurrent calls limits. The default value 0 means no limit.

- **Music on hold**  
  Used to set hold music for the system.

- **Tone Region**  
  Please select your country or nearest neighboring country to enable the default dial tone, busy tone, and ring tone for your region.  
  **Note:** please reboot the system to take effect.

- **Dsp Fax**  
  Enable Dsp to optimize Fax reception.

- **FXO Mode**  
  FXO port's operation mode.

- **Virtual Ring Back Tone**  
  It's only for GSM/UMTS /UMTS trunk. Once enabled, when the caller call out with GSM/UMTS trunks, the caller will only hear the virtual ring back tone generated by the system before callee answers the call.

- **Distinctive Caller ID**  
  When incoming calls are routed from ring group/queue/IVR, the caller ID displays with the name of ring group/queue/IVR, for example 5503302(ringgroup_default).  
  **Note:** To display IVR's name, please press the key instead of the extension number directly.

- **Attended Transfer Caller ID**  
  When transferring an incoming call using the attended transfer feature code or the transfer key of IP phone, the Caller ID of transferee or transferer displayed on the screen of the callee. The default display is the Caller ID of the initiator.  
  For example, if extension 500 makes a call to extension 501. After 501 picks up the call, 501 makes an attended transfer to extension 502. If selecting “Transferer”, 502 will display the Caller ID as 500; if selecting “Transferee”, 502 will display the Caller ID as 501.

- **Follow Me Prompt**  
  When set “Follow me” to “Transfer to number” on the extension page (e.g. when 500 is busy, transfer to 501), while 500 is busy, the call will be transferred to 501. If “Enable Follow Me Prompt” choosing yes, there will be prompt before transferring the call. Otherwise, the call will be transferred directly without any prompt. Default: Yes.
· **Music on Hold for Follow Me Prompt**
  Configure whether to play a prompt “please hold while I try to locate the person you are calling” when transfer a call by follow me settings.

· **Invalid Phone Number Prompt**
  Configure the prompt when the dialed phone number is invalid.

· **Busy Line Prompt**
  Configure the prompt when the dialed phone number is busy.

· **Dial Failure Prompt**
  Configure the prompt when dial failed due to conjunction no-available channel.

2) Web Server

· **HTTP**
  Enable or disable HTTP session.

· **HTTP Bind Port**
  Default port to use for HTTP session is 80.

· **HTTPS**
  Enable or disable HTTPS session.

· **HTTPS Bind Port**
  Default port to use for HTTPS session is 443.

**Note**: please reboot the system to take effect.

3) Extension Preferences

· **User Extensions**
  The default value is 500 to 616

· **Ring Group Extensions**
  The default value is 620 to 629

· **Paging Group Extensions**
  The default value is 630 to 639

· **Conference Extensions**
  The default value is 640 to 659

· **IVR Extensions**
  The default value is 660 to 679
**6.6.2 Business Hours**

Business Hours setting including “Holidays” is used to control the incoming calls, we can configure it in this page.

![Business Hours Settings](image)

**Figure 6-60 Business Hours Settings**

1) **General**
   - **Enable Business Hours**
   - **Disable Business Hours**

2) **Others**
   - **Enable Office Closed Timing**
     By dialing *81 (*81 is the default code) on an extension will force the office time closed for the device whatever the general setting is.

   - **Enable Office Timing**
     By dialing *82 (*82 is the default code) on an extension will force the office time to take effect for the device whatever the general setting is.

   - **Disable Office closed timing**
     By dialing *081 (*081 is the default code) on an extension will disable the Office Closed Timing.

3) **Add office hours**
You can set up the business hours here.

4) Add Holiday
You can set up the holidays here.
If a time period is configured as both Holidays and office hours, it will be treated as Holidays.

6.6.3

There are many feature codes available in MyPBX, which allow users to dial from extension side to realize the exact feature.

![Feature Code Settings Page](image)

Figure 6-61 Feature Code Settings Page

1) General
   · **One Touch Record**
     A user may initiate or stop call recording by dialing *1 during a call. (*1 is the default setting).

   · **Extension for Checking Voicemail**
     Users can check their Voicemail by dialing *2 on their phone (*2 is the default setting).

   · **Voicemail for Extension**
     Users can leave a voicemail to other extensions by dialing # on their phone or the incoming call could be forwarded to an extension’s voicemail directly. (# is the default setting).

   For example, extension 500 want to leave a message for extension 501, users
can use 500 dial “#501” to enter the voicemail of 501.

- **Voicemail main menu**
  Users can go to the main menu by dialing *02 (*02 is the default setting).

- **Attended Transfer**
  Users may transfer an incoming call by dialing *3 on their phone (*3 is the default setting).

- **Attended Transfer Timeout**
  The timeout value of transferring a call

- **Blind Transfer**
  Users may blind transfer an incoming call by dialing *03 on their phone (*03 is the default setting).

- **Call Pickup**
  Users may pick up an incoming call by dialing *4 on their phone (*4 is the default setting).

- **Extension Pickup**
  Users may pick up a specific extension’s incoming call by dialing *04 + extension number on their phone (*04 is the default setting).

- **Intercom**
  Define the feature code that is used to dial an extension in intercom mode. For instance, setting this value to *5 would allow you to initiate an intercom call with extension 501 by dialing *5501.

- **Normal Spy**
  In this mode, you can only listen to the extension being spied, for example you can dial *90501 to monitor extension 501.

- **Whisper Spy**
  In this mode you can listen/whisper to the extension being spied, for example, dialing *91501 to listen to extension 501, you can also talk with 501 too.

- **Barge Spy**
  In this mode, you can barge in both extensions involved in the call, for example dialing *92501 to barge in and talk with extensions on both sides.

2) Call Park Preferences

- **Call Parking**
  User may park an incoming call on his own telephone by pressing “*6” (*6 is the
default setting)

- **Extension range used to park calls**
User may park an incoming call on a designated extension at first and then pick up the call again on any other extensions.

- **Number of seconds a call can be parked before it is recalled.**
Define the time (in seconds) that a call can be parked before it is recalled to the station that parked it.

3) Call Forwarding Preferences

- **Reset to Defaults**
Users may reset all call forwarding defaults by calling *70 on their phone (*70 is the default setting).

**Note**: When reset to defaults. The call forwarding settings will be configured as follows:
- Always forward: Disabled
- Busy forward to Voicemail: Enabled
- No answer forward to Voicemail: Enabled
- Do not disturb: Disabled

- **Enable Forward All Calls**
Users may enable always forward by calling *71 on their phone (*71 is the default setting)

- **Disable Forward All Calls**
Users may disable always forward by calling *071 on their phone (*071 is the default setting)

- **Enable Forward When Busy**
Users may enable busy forward by dialing *72 on their phone (*72 is the default setting)

- **Disable Forward When Busy**
Users may disable busy forward by calling *072 on their phone (*072 is the default setting)

- **Enable Forward No Answer**
Users may enable no answer forward by calling *73 on their phone (*73 is the default setting)

- **Disable Forward No Answer**
Users may disable no answer forward by calling *073 on their phone (*072 is
Users may activate call forwarding by dialing this feature code, followed by the extension or phone number to forward all calls to this number.

**Note:** Users may activate Forward to number by dialing *74 + phone number. E.g. by dialing *74501, all calls will be forwarded to extension 501.

- **Forward to Voicemail**
  Users may forward the call to Voicemail by calling *074 on their phone (*074 is the default setting)

- **Enable Do Not Disturb**
  Users may enable Do Not Disturb by calling *75 on their phone (*75 is the default setting)

- **Disable Do Not Disturb**
  Users may disable Do Not Disturb by calling *075 on their phone (*075 is the default setting)

### 6.6.4 Voicemail Settings

In this page, we can configure some settings for voicemail feature, including general voicemail settings and SMTP settings, which is used for "voicemail to email".

![Figure 6-62 General Voicemail Settings](image)
1) General Voicemail Settings

a) Message Options

- **Max Messages per Folder**
  Set the maximum number of messages that can be stored in a single voicemail box.

- **Max Message Time**
  Set the maximum length of a single voicemail message.

- **Min Message Time**
  Set the minimum length of a single voicemail message. Messages below this threshold will be automatically deleted.

- **Ask Caller to Dial 5**
  If this option is set, the caller will be prompted to press 5 before leaving a message.

- **Operator Breakout from Voicemail**
  If this option is set, the caller can jump out of the voicemail and go to the destination (IVR) you set by dialing “0”.

b) Greeting Settings

- **Busy Prompt**
  Greeting played when the extension called is busy.
  - Skip greeting: Do not play a greeting.
  - Play busy greeting: play the extension busy greeting.

- **Unavailable Prompt**
  Greeting played when the extension called is Unavailable.
  - Skip greeting: Do not play a greeting.
  - Play Unavailable greeting: play the extension Unavailable greeting.

- **Leave a Message Prompt**
  Greeting played to ask the caller to dial 5 to leave a message.
  - Skip greeting: Do not play a greeting.
  - Play busy greeting: play the extension busy greeting.
  - Play Unavailable greeting: play the extension Unavailable greeting.

c) Playback Options

- **Announce Message Caller ID**
  If this option is enabled, the Caller ID of the party that left the message will be played back before the voicemail message begins playing.
· **Announce Message Duration**
If this option is set, the duration of the message in minutes will be played back before the voicemail message begins playing.

· **Announce Message Arrival Time**
If this option is set, the arrival time of the message will be played back before the voicemail message begins playing.

· **Allow Users to Review Messages**
Allow callers to review their recorded message before sending it to voicemail.

2) **SMTP Settings for Voicemail**
**Note:** If you want to send voicemail messages as email attachments, please configure this section.

![SMTP Server Settings](image)

**SMTP Settings For Voicemail**

- **E-mail Address**
The E-mail Address that MyPBX will use to send voicemail.

- **Password**
The password for the email address used above

- **SMTP Server**
The IP address or hostname of an SMTP server that the MyPBX will connect in order to send voicemail messages via email, e.g. mail.yourcompany.com.

- **Port**
SMTP Port: the default value is 25.

- **Use SSL/TLS to send secure message to server**
If the email sending server needs to authenticate the sender, you need to select the check box.
**Note:** Must be selected for Gmail or exchange server.
After filling out the above information, you can click on the “Test Account
Settings” button to check whether the setup is OK.
1) If the test is successful, you can use the email safely.
2) If the test failed, please check if the above information is input correctly or if the network is OK.

6.7 Advanced Settings

6.7.1

1) General

![SIP Settings-General](image)

**Figure 6-64 SIP Settings-General**

- **UDP Port**
  Port used for SIP registrations. The default is 5060.

- **TCP Port**
  Port used for SIP registrations. The default is 5060.

- **TLS Port**
  Port used for SIP registrations. The default is 5061.

- **TLS Verify Server**
  When using MyPBX as a TLS client, whether or not to verify server’s certificate. It is "No" by default.
·TLS Verify Client
When using MyPBX as a TLS server, whether or not to verify client’s certificate. It is “No” by default.

·TLS Ignore Common Name
Set this parameter as “No”, then common name must be the same with IP or domain name.

·TLS Client Method
When using MyPBX as TLS client, specify the protocol for outbound TLS connections. You can select it as tlsv1, sslv2 or sslv3.

·RTP Port Start
Beginning of RTP port range

·RTP Port End
End of RTP port range

·DTMF Mode
Set default mode for sending DTMF. Default setting: rfc2833

·Max Registration/Subscription Time
Maximum duration (in seconds) of a SIP registration. The default is 3600 seconds.

·Min Registration/Subscription Time
Minimum duration (in seconds) of a SIP registration. The default is 60 seconds.

·Default Incoming/Outgoing Registration Time
Default Incoming/Outgoing Registration Time: Default duration (in seconds) of incoming/outgoing registration.

·Register Attempts
The number of SIP REGISTER messages to send to a SIP Registrar before giving up. The default is 0 (no limit).

·Register Timeout
Number of seconds to wait for a response from a SIP Registrar before considering the register has timed out. The default is 20 seconds.

·Calling Channel Codec Priority
Once enabled, when dialing out via SIP/SPS trunks, the codec of calling channel will be selected in preference. If not, MyPBX will follow the priority in your SIP/SPS trunks.
- **Video Support**  
  Support for SIP video or no. The default is yes.

- **Max Bit Rate**  
  Configure the max bit rate for video stream. The default: 384kb/s

- **DNS SRV Look Up**  
  Please enable this option when your SIP trunk contains more than one IP address.

- **User Agent**  
  To change the user agent parameter of asterisk, the default is "MyPBX"; you could change it if needed.

2) **NAT**

![Figure 6-65 SIP Settings-NAT](image)

**Note:** Configuration of this section is only required when using remote extensions.

- **Enable STUN**  
  STUN (Simple Traversal of UDP through NATs) is a protocol for assisting devices behind a NAT firewall or router with their packet routing.

- **STUN Address**  
  The STUN server allows clients to find out their public address, the type of NAT they are behind and the internet side port associated by the NAT with a particular local port. This information is used to set up UDP communication between the client and the VOIP provider and so establish a call.

- **External IP Address**  
  The IP address that will be associated with outbound SIP messages if the system
is in a NAT environment.

**·External Host**
Alternatively you can specify an external host, and the system will perform DNS queries periodically.
This setting is only required when your public IP address is not static. It is recommended that a static public IP address be used with this system. Please contact your ISP for more information.

**·External Refresh Interval**
If an external host has been supplied, you may specify how often the system will perform a DNS query on this host. This value is specified in seconds.

**·Local Network Identification**
Used to identify the local network using a network number/subnet mask pair when the system is behind a NAT or firewall.
Some examples of this are as follows:
“192.168.0.0/255.255.0.0”: All RFC 1918 addresses are local networks;
“10.0.0.0/255.0.0.0”: Also RFC1918;
“172.16.0.0/12”: Another RFC1918 with CIDR notation;
“169.254.0.0/255.255.0.0”: Zero conf local network.
Please refer to RFC1918 for more information.

**·NAT Mode**
Global NAT configuration for the system; the options for this setting are as follows:
Yes = Use NAT. Ignore address information in the SIP/SDP headers and reply to the sender's IP address/port.
No = Use NAT mode only according to RFC3581.
Never = Never attempt NAT mode or RFC3581 support.
Route = Use NAT but do not include rport in headers.

**·Allow RTP Reinvite**
By default, the system will route media steams from SIP endpoints through itself. Enabling this option causes the system to attempt to negotiate the endpoints to route packets to each other directly, bypassing the system. It is not always possible for the system to negotiate endpoint-to-endpoint media routing.

3) Codecs
A codec is a compression or decompression algorithm that is used in the transmission of voice packets over a network or the Internet.

**u-law**: A PSTN standard codec, used in North America, which provides very good voice quality and consumes 64kbit/s in each direction (receiving and transmitting) of a VoIP call.

**a-law**: A PSTN standard codec, used outside of North America, which provides very good voice quality and consumes 64kbit/s in each direction (receiving and transmitting) of a VoIP call.

**GSM**: A wireless standard codec, used worldwide, that provides adequate voice quality and consumes 13.3kbit/s in each direction (receiving and transmitting) of a VoIP call. GSM is supported by many VoIP phones.

**SPEEX**: Speex is an Open Source/Free Software patent-free audio compression format designed for speech. The Speex Project aims to lower the barrier of entry for voice applications by providing a free alternative to expensive proprietary speech codecs. Moreover, Speex is well-adapted to Internet applications and provides useful features that are not present in most other codecs.

**G.722**: G.722 is a wideband speech coding algorithms which supports the bit rate of 64, 56 and 48kbps wideband. It's a broadband voice encoding of G series.

**G.726**: A PSTN codec, used worldwide, that provides good voice quality and consumes 32kbit/s in each direction (receiving and transmitting) of a VoIP call. G.726 is supported by some VoIP phones.

**ADPCM, G.729A, H261, H263, H263p, H264, MPEG4**.

**Note**: If you would like to use G.729, please enter your license.
4) QoS

QoS (Quality of Service) is a major issue in VoIP implementations. The issue is how to guarantee that packet traffic for a voice or other media connection will not be delayed or dropped due to interference from other lower priority traffic. When the network capacity is insufficient, QoS could provide priority to users by setting the value.

5) T.38

- **Re-invite SDP Not Add T.38 Attributes**
  If set to Yes, SDP in re-invite packet will not add T.38 attributes.

- **Error Correction**
  Re-invite SDP T38FaxUdpEc.

- **T38 Max Bit Rate**
  Set T38 Max Bit Rate.

6) Advanced Settings
·From Field
Where to get the caller ID in SIP packet.

·To Field
Where to get the DID in SIP packet.

·180 Ringing
It is set when the telecom provider needs. Usually it is not needed.

·Remote Party ID
Whether to send Remote-Party-ID on SIP header or not. Default: no.

·Allow Guest
Whether to allow anonymous registration extension or not. Default: no.
This option is used to avoid some anonymous calls by hackers. For more details about the system security configuration, please refer to APPENDIX BMypBX Security Configuration Guide.

·Pedantic
Enable pedantic parameter. Default: no.

·Alwaysauthreject
If enabled, when MyPBX rejects “Register” or “Invite” packets, MyPBX always respond the packets using “SIP404 NOT FOUND”.

·OPTIONS Response 200
If set to yes, the response to an OPTIONS is always 200 OK.

·Session -timers
Enable session-timer mode, default: yes
- **Session-expires**
  The max refresh interval

- **Session-minse**
  The min refresh interval, which mustn't be less than 90s.

- **Session-refresher**
  Choose session-refresher, the default is Uas.

### 6.7.2 IAX Settings

![Figure 6-70 IAX Settings](image)

1) **General**

- **Bind Port**
  Port use for IAX2 registrations, Default is 4569.

- **Bandwidth**
  Low/medium/high with this option you can control which codec to be used.

- **Min Registration Time**
  Minimum duration (in seconds) of an IAX2 registration. The default is 60 seconds.

- **Max Registration Time**
  Maximum duration (in seconds) of an IAX2 registration. The default is 1200 seconds.

2) **Codecs**

A codec is a compression or decompression algorithm that used in the transmission of voice packets over a network or the Internet.

**u-law**: A PSTN standard codec, used in North America, which provides very
good voice quality and consumes 64kbit/s in each direction (receiving and transmitting) of a VoIP call.

**a-law:** A PSTN standard codec, used outside of North America, which provides very good voice quality and consumes 64kbit/s in each direction (receiving and transmitting) of a VoIP call.

**GSM:** A wireless standard codec, used worldwide, that provides adequate voice quality and consumes 13.3kbit/s in each direction (receiving and transmitting) of a VoIP call. GSM/UMTS is supported by many VoIP phones.

**SPEEX:** Speex is an Open Source/Free Software patent-free audio compression format designed for speech. The Speex Project aims to lower the barrier of entry for voice applications by providing a free alternative to expensive proprietary speech codecs. Moreover, Speex is well-adapted to Internet applications and provides useful features that are not present in most other codecs.

**G.726:** A PSTN codec, used worldwide, that provides good voice quality and consumes 32kbit/s in each direction (receiving and transmitting) of a VoIP call. G.726 is supported by some VoIP phones.

**ADPCM, G.729A, H261, H263, H263p, H264.**

**Note:** If you would like to use G.729, please enter your license.

### 6.7.3 Blacklist

Blacklist is used to block an incoming/outgoing call. If the number of incoming/outgoing call is registered in the number blacklist, the caller will hear the following prompt: “The number you have dialed is not in service. Please check the number and try again”. The system will then disconnect the call.

![Figure 6-71 Blacklist List](image_url)

We can add a number with the type: inbound, outbound or both.
**Figure 6-72 Add a Number as Blacklist**

**Note:** Add a phone number in blacklist, such as “05921234567”:

1) If the type is “inbound”, then this number can’t be called.
2) If the type is “outbound”, then the extensions in MyPBX can’t call this number.

### 6.7.4 Callback Settings

MyPBX allows caller A to dial an inbound route number, and after hearing the ring, A can hang up the call or wait for MyPBX to cut off the call, then MyPBX will call A with this number. When A picks up the call, A can dial the number he wants to call; MyPBX will call the number with its outbound route.

**Notes:**
1. If you’d like to use callback feature, please make sure it’s enabled on the inbound route setting panel.
2. No callback rules needed to be set if the trunk supports call back with the caller ID directly.

**• Allow All Numbers**

If you want to apply Callback function to all incoming numbers, please tick Allow All numbers.
Follow the steps below to use this function.

**Step 1: Enable Callback.**

Inbound Routes – Choose “Yes” on “Enable Callback” to enable this function.

**Step 2: Create Callback number**

**Step 3: Create Callback Rules**

You will need to create callback rules when the system should strip or add digits.

- **Trunk Name**
  Choose the trunk with callback rules

- **Strip digits from front**
  Define how many digits will be stripped from the call in number before the callback is placed. For example, when you call from number 123456789 into MyPBX, the caller ID is 0123456789, but you can only call 123456789 successfully from MyPBX trunk. You should configure number 0123456789 as
the call back number and strip 1 digit before the callback is placed

**·Prepend before dialing**

Define digits added before a callback number before the callback is placed. For example, the call in number (Caller ID) is 123456789, MyPBX need to send 9123456789 to its trunk when calling this number. You should configure 123456789 as the call back number and add 9 before the callback is placed. You can add “w” for analog trunks for some delay too.

### 6.7.5

DNIS (Dialed Number Identification Service) is a telephone service that identifies for the receiver of a call the number that the caller dialed.

![Figure 6-77 Add a New DNIS](image)

**Note:** If DID is not configured here, all the calls via this trunk will show the DNIS instead of the original caller ID.

### 6.7.6

DISA (Direct Inward System Access) allows someone calling in from outside the telephone switch (PBX) to obtain an “internal” system dial tone and make calls as if they were using one of the extensions attached to the telephone switch. To use DISA, a user calls a DISA number, which invokes the DISA application. The DISA application in turn requires the user to enter a PIN number, followed by the pound sign (#). If the PIN number is correct, the user will hear dial tone on which a call may be placed. Obviously, this type of access has serious security implications, and great care must be taken not to compromise your security.
1) General

- **DISA Name**
  Give this DISA application a name to help you identify it.

- **PIN**
  The password for this DISA

- **PIN Settings**
  Click to add, delete or edit PIN list.

- **Response Timeout**
  The maximum amount of time the system will wait before hanging up the call if the user has dialed an incomplete or invalid number. The default is 10 seconds.

- **Digit Timeout**
  The maximum amount of time permitted between each digit when the user is dialing an extension number. The default is 5 seconds.

2) Member Outbound Routes

Used to set the outbound routes that can be accessed from this DISA.

**6.7.7**

PIN User is used to manage lists of PINs that can be used to access restricted features such as Outbound Routes.
1) Options
   - **Access Code**
     Dial this code to access PIN.

   - **Prompt for Entry**
     Prompt caller enter the PIN Number.

   - **Prompt for Entry Failure**
     Prompt the caller when an invalid PIN is entered.

2) PIN User
   MyPBX can store a number of PIN Users. PIN Users may be used to keep track of calls in relation to particular activities or clients. They can also be used to keep track of calls by particular users or sets of users.

   - PIN entered is checked against those stored by the system. If an invalid PIN is entered, the PIN is requested again.
• The system administrator can configure certain numbers or types of numbers to require entry of a PIN before you can continue making a call to such a number.
• The system administrator can also configure you to have to enter a PIN before making any external call.

- **Name**
  A character-based name for this PIN list, e.g. “YeastarPIN”

- **PIN**
  The password for this PIN list

- **PIN Settings**
  Click to add, delete or edit PIN list.

- **Member Outbound Route**
  PIN User can use those outbound route to make call out.

### 6.7.8

In this page users can manage all the passwords of outbound routes, PIN User, and DISA.

![Figure 6-81 Add PIN List](image)

- **Name**
  A character-based name for this PIN list, e.g. “YeastarPIN”

- **Record in CDR**
  If set to yes, the PIN code will be displayed in call log.
---PIN list
PIN list is a numeric field. Letters and punctuation are not allowed in this field. Fill in one PIN and if you end with enter for each PIN, you could create multiple PINs.

6.7.9

Paging is used to make an announcement over the speakerphone to a phone or group of phones. Targeted phones will not ring, but instead answer immediately into speakerphone mode. Please note that this section is for configuring paging groups. If you would like to configure Intercom settings, please open the Other Settings -> Feature Codes.

This feature is supported by the following SIP phones:
Yealink’s T28, T26, T22, T20, T10T, T9CM. Other SIP devices may also work with this feature but are not officially supported.

**Note:** A paging group can have a maximum of 20 members.

---

**Figure 6-82 Paging Group List**
In this mode, if you dial its number, MyPBX will help to pick up those chosen members and you can talk directly without any rings.

**Figure 6-83 Add/Edit Internal Paging Group**
**Paging Group Number**
Define the numbered extension that may be dialed to reach this group.

**Duplex**
Paging is typically one way for announcements only. Checking this will make paging duplex, allowing all users in the group to talk and be heard by all.

***Answer**
If it sets Yes, any user in the group will talk with the caller when they press “*”. If it sets No, users in the group can talk with each other without pressing “*”.

### 6.7.10 SMS Settings

When GSM/UMTS modules are installed, SMS feature is supported.

1) **Enable SMS to Email**

![Enable SMS to Email](image)

Figure 6-84 Enable SMS to Email

If you enable this, as soon as the GSM/UMTS trunks receive a short message, MyPBX will send the text of this message to the email addresses listed on the Email List.

You can add email addresses to the Email List.

![SMS to Email Settings](image)

Figure 6-85 SMS to Email Settings
2) Enable Email to SMS
If you enable this, you can use MyPBX to send out message by sending an email to the specified address.

- **Enable Country Code**
  If you want to add country code before the dialed numbers, please tick this.

- **Country Code**
  If you enable country code, the country code will be added before the numbers which you want to send SMS. Also you can use a custom country code, which makes it more flexible.

- **Receive mails every**
  The interval time of receiving mails from POP3 server

- **Access Code**
  This PIN code is used to verify the subject of the emails received. If the form of email passes the verification, it will be send out by SIM card. If not, this email will be deleted immediately.

3) Email Settings

Note:
1. If you want to use “SMS to Email”, please configure POP3 setting.
2. If you configure the POP3 setting, MyPBX will download emails from the mail server regularly. Once downloaded, the emails will be deleted from the mail server.
· **Email Address**
  This email address will be used to:
  1. Send email to the addresses listed on “SMS to Email” setting.
  2. Receive email and send the text of the email to the target mobile number by SMS.
  Note: If you use Gmail, just put your user name here. E.g. email address: test@gmail.com, you just put “test” here.

· **Password**
  Input the password of this email here.

· **SMTP Server (SMTP)**
  · **SMTP Server Port**
  · **Receive Server (POP3)**
  · **Receive Server Port**

If you want to know more about Email to SMS, please refer to **APPENDIX G**

### 6.7.11 Certificates

MyPBX can support TLS extension. Before you register TLS extension on IP phone, you should upload certificates first.

![Upload Certificate](image)

**Figure 6-88 Upload Certificate**

**Trusted Certificate**
This certificate is a CA certificate. When selecting “TLS Verify Client” as “Yes”, you should upload a CA. The relevant IP phone should also have the according server certificate.

**PBX Certificate**
This certificate is server certificate. No matter selecting “TLS Verify Client” as “Yes” or “NO”, you should upload this certificate to MyPBX. If IP phone enables “TLS Verify server”, you should also upload the according CA certificate on IP phone.
7 Reports

Click to access.

We can check the call detailed logs for counting and system log for debugging.

7.1

The call Log captures all call details, including call time, caller number, callee number, call type, call duration, etc. An administrator can search and filter call data by filter the call logs by call date, caller/callee, trunk, duration, billing duration, status, communication type and PIN User.

![Figure 7-1 Call Log List](image)

7.2

You can download and delete the system logs of MyPBX.

**Options**

- Enable Hardware Log
Save the information of hardware; (up to 4 log files)

- **Enable Normal Log**
  Save the prompt information; (up to 16 log files)

- **Enable Web Log**
  Save the history of web operations (up to 2 log files)

- **Enable Debug Log**
  Save debug information (up to 2 log files)

**Packets Capture Tool**
This feature is used to capture packets for technician. Integrate packet capture tool “Wireshark” in MyPBX. Users also could specify the destination IP address and port to get the packets.

- **IP**
  Specify the destination IP address to get the packets.

- **Port**
  Specify the destination Port to get the packets.

- **NIC**
  Choose the NIC (LAN or WAN) which you want to capture the packets.

---

**8 Addons**

Click to enter “Addons” page.
8.1 Addons Settings

MyPBX supports many addons to enhance the function of MyPBX. In this page, you can install the according addons, including MyPBX Client, Bill System and Hotel Module. Before you install an addon, you should have a license. You can buy the license from Yeastar.

![Addon Page](image)

Figure 8-1 Addon Page

8.1.1 MyPBX Client

MyPBX Client is an application coordinated with MyPBX that connects your PC and IP phones. With MyPBX Client, you can perform various operations including check extension status, manage contacts, voicemails, and CDR of extension, realize click-to-call and call popup, send instant messages between extensions, initiate a conference call, and create a call task, etc.

For more details about MyPBX client, please refer to the link below:

http://www.yeastar.com/Solutions/MyPBX_Client_Solution.asp

8.1.2 Billing System

Billing System caters for the growing need of billing solutions that can efficiently monitor the calls and maintain record of each call received/transferred by IP-PBX. Billing System can charge and recharge extensions and conduct analysis on the basis of statistics. Both prepaid and postpaid are supported. Flexible rate settings and detailed records make it extremely easy for enterprise to monitor charges, spot misuse, and enhance efficiency. With Billing System, call accounting are just clicks away.

Note: If Billing System is enabled, DISA and Callback functions would be disabled.

For more details about Bill System, please refer to the link below:
8.1.3 Hotel Module

MyPBX Hotel Module is designed for inns and hotels. The features include Room Status, Booking, Check In, Check Out, Wakeup Call, Do Not Disturb, Mini Bar, and Billing Report.

For more details about “Hotel Module”, please refer to the link below: http://www.yeastar.com/Solutions/Hotel_Module_Solution.asp

8.2 Billing Settings

8.2.1 Extensions

Total Charge
The total charge of all extensions.

Note: The mobility extension will be charged, and the bill is added to the corresponding extension.

Book Balance
The total balance of all extensions.

Click  to edit the extension settings.
**Extension**
Extension number, un-editable.

**Name**
You can rename the extension to whatever you want. The extension name here and the extension name in PBX extension page will be changed to the same whichever changes.

**Password**
The extension’s password, which is always the same as the voicemail PIN on extension page.

**Status**
Administrator can set it to Free or Locked. If it’s locked, this extension can’t make outbound calls.

**Limit Credit**
If Prepayment is chosen, when your balance is below the limit of credit, your outbound call will be blocked. If Post-payment is chosen, the limit of credit means the maximum money you can owe.

**Pay Type**
Prepayment or Post-payment.

Click ![Recharge Button] to recharge this extension.
8.2.2 Rate

Click “Rate” to start editing the rate rules, you can also import the rules you have edited in advance and export the rules. The format is *.csv.

**Import**
Import the configuration file of rate.

**Export**
Export the configuration of the rate.

**Click “Add New Rate” to start editing the details.**
1) General

**Prefix number**
It’s the Prefix of the called number. It must match the dial pattern of the outbound routes in MyPBX. Leave it blank means matching all dial patterns.

**Number Length**
It is the total length of the number processed by MyPBX when calling outbound (including the dial pattern and the number stripped by MyPBX). If dial pattern is “9.”, Strip “1” digit and there is no prepended number, when you dial “95503305”, the number length is “8”. If dial pattern is “9.”, Strip “1” digit, and prepend “17951”, when you dial 95503305, the number length is “13”. Put “0” here to apply to numbers of all lengths. Leave it blank means matching all numbers.

**Rate**
The rate of one billing unit. Users are able to enter a rate value that has 4 digits after the decimal point and the billing precision is up to 4 digits after the decimal.

*Note: the currency symbol can be changed in the General Setting as required.*

**Billing Unit**
If the rate is €0.2 and billing unit is 60 seconds, the call you make will cost €0.2 per 60 seconds (less than one billing unit will be regarded as one billing unit).

2) Other Settings
**Days of week**
Choose the days on which this rate takes effect.

**From & To**
The time period of this rate takes effect in a day.

**Initial Cost & Initial time**
If the “Initial Cost” is €0.2 and the “Initial Time” is 120 seconds, it means the first 120 seconds of this call will cost €0.2.

**Apply to all extensions**
Apply this rate to the following extensions or just tick “Apply to all extensions” to apply to all.
8.2.3 Emergency Number

Add Emergency Number as required.
Note: Don’t forget to add the outbound dial prefix if you would like to dial the emergency number through a trunk.

8.2.4 Scheduled Task

The task will be operated depending on the time condition and the selected members.
• **Name**  
  Input the task name. You can’t use the same name.

1) **Time Condition**  
   **· Time**  
   It is the start time of the task. The format is "HH:MM" e.g. 12:00.

   Every Day: if checked, task will be operated every day.  
   Every Month: if checked, task will be operated every month.  
   Date: it can be from 1 to 31.  
   Every Week: if checked, task will be operated every week.  
   Weekly: it can be from Sunday to Saturday.

2) **Members**  
   Move an extension to the "Selected" box to make the task applicable to it.

3) **Operation**  
   Locked: if checked, the selected members can’t dial out.  
   Free: if checked, the selected members can dial out.  
   Recover Balance: if checked, the configured number will become the balance.  
   Charge in card: if checked, the configured number will be added to the balance.

8.2.5 **General Setting**

![General Setting](image)

**· Currency**  
It can be changed as required.

**· Dial Emergency Number when out of credit**  
If set to yes, you can dial emergency number when you run out of credit.

**· Insufficient Balance Prompt**  
If set to Null, the system will use the default voice prompt.

**· Extension Lock Prompt**  
If set to Null, the system will use the default voice prompt.
Note: The custom prompt can be chosen if you have uploaded it to MyPBX "Custom Prompts" page.

8.2.6 Recharging History

Click “Recharging History” to check the details. You can also clear all balance.

1) Recharge

Click “Recharge” and then choose the extension and put in the amount.

In this example, the recharge amount of the selected extension 300 is €50

2) Clear balance
In this example, the chosen extension 300’s balance will be cleared.

8.2.7 Call Logs

It’s the history of all calls generated by extensions. You can download, delete and search the records by date and/or extension number.

Start Search
When there are a great number of calls, you can query call logs by time and extension number.

Calls
The total number of the calls.

Total Duration
The total duration of all calls.

Average Duration
The average duration of all the calls.

Expense
The total expense of all calls.
Download and delete CDR. You can click “Download the Selected CDR” to download CDR to your PC; also you can click “Delete the Selected CDR” or “Delete All CDR” to delete the CDR.

Note: Only the logs of the latest 3 months will be saved.

**8.2.8 Statistics**

You can check the statistics here. You can list the statistics by extension number, date, day, month or year.

![Statistics](image)

**Date**
The date of the call

**Calls**
The number of the calls

**Total Duration**
The total duration of all the calls

**Average Duration**
The average duration of each call

**Amount**
The total cost of all the calls
9 Logout

Click Logout to log out safely.
10. Use MyPBX

10.1 Make outbound call

To make an outbound call, we need to add trunk first. There are 3 types of VoIP Trunk.

**Digital Trunk:** E1/T/J1 ports of MyPBX, connected to the ISDN provider. You need to get the detailed signaling type from the provider before configuring the E1 trunk.

**VoIP Trunk:** Connected to remote VOIP service server. You should get an IP address with user name/password from the provider.

**Service Provider:** Connected to service provider server. You will get only IP address for authorization.

**Analog Trunk:** FXO ports of MyPBX, connected to a local PSTN.

**GSM/UMTS Trunk:** GSM ports of MyPBX, connected to GSM Network.

**BRI Trunk:** BRI ports of MyPBX, connected to ISDN provider

What are FXO and FXS?

**FXS** (Foreign Exchange Station) is an interface which drives an analog telephone or FAX machine. FXS interfaces deliver power, provide ringing, and use FXO signaling. FXS interfaces are what allow you to hook telephones and other analog devices to your PBX.

**FXO** (Foreign Exchange Office) is an interface that connects to a phone line to supply your PBX with access to a public telephone network. FXO interfaces use...
FXS signaling. FXO interfaces allow you to connect your PBX to real analog phone lines.

**10.1.1 Sample Routing via E1 Trunk**

Let’s route all inside extensions through an E1 trunk by dialing 9. In Outbound Routes, add a new outbound route as below.

![Create Outbound Route for E1 Trunk](image)

As we can see from the outbound route of “pstylout”, all phone numbers starting with 9 will have their first digit stripped off (digit 9) and will be sent to the E1.

After we have configured the above, we can dial 9 + local number to dial out via an E1 trunk.
**Note:** Setting number prefix to wild card X. and setting Strip to 0 digits from the front will allow all calls to go through this outbound route directly.

### 10.1.2 Sample Routing via VoIP Trunk

Let’s configure all inside extensions to dial ”0” through the VoIP Trunk.

**1. Add VoIP service provider**

Before we do add this, please make sure you have a VoIP Trunk account.  
Trunks→VoIP Trunk →SIP Trunk  
Enter your account information on this page, and click Save.
2. Add Outbound Routes

As we can see from the Outbound Route of "VOIP_OUT", all phone numbers starting with 0 will have their first digit stripped off (digit 0) and will be sent to the SIP Trunk.

![Figure10-4 Create an Outbound route for VOIP trunk](image)

Now that we have added two outbound dialing rules, any call starting with 9 will be routed to the PSTN, and any number starting with 0 will be routed to the SIP Trunk.
10.2 Incoming call

10.2.1 Sample Routing to an IVR

Let’s configure an incoming call to route to the IVR. In the IVR itself, let’s configure digit 0 to route the call to extension 300, and digit 1 to route the call to extension 301.

1. Add IVR
To add a new IVR, go to IVR → Create New IVR
2. Add Inbound Routes

As we can see from the Inbound Route of "VOIP_IN", all incoming calls will be sent to the IVR.
APPENDIX A FAQ

Q1. How to Register SIP devices?

A1:
1) Register SIP softphone
Download the x-lite softphone from CounterPath website
www.counterpath.com
After installing the x-lite, right click the panel and select the SIP Account setting and then configure it.
- **Display Name**: 500
- **User Name**: 500
- **Password**: 500
- **Authorization Name**: 500
- **Domain**: 192.168.5.150

2) Register IP Phone (for example, Yealink’s T28 IP Phone)
   a) Connect the T28’s Internet port to the switch. And it can get the IP from your route.
   b) Press the "OK" key on T28 to get the IP of T28.
   c) Put the IP on web browser then you can enter the T28 configure page through this IP.
   d) Put the SIP extensions info on the T28 IP phones.
- **Display Name**: 501
- **User Name**: 501
- **Register Name**: 501
- **Password**: 501
- **SIP Server**: 192.168.5.150
Use the same method register another T28 to other extension.

**Q2. How do I reset MyPBX back to the factory default settings?**

**A2**: To perform a reset, please follow steps below:

**Step 1**: hold down the “Reset” button on the back of the unit for 5 seconds and watch the LEDs on the front of the MyPBX. When the status LED turns red, let go of the reset button.

**Step 2**: when the RUN status LED starts blinking, MyPBX will be set back to factory defaults.

**Step 3**: to access the configuration page, navigate to 192.168.5.150 using a web browser. Make sure that you are on the 192.168.5.0 subnet before doing this.

**Step 4**: log in to the device with the username “admin” and the password “password”, and reconfigure the device.

**APPENDIX B MyPBX Security Configuration Guide**

VoIP attacks, although it is not an everyday occurrence, it does exist. While using VoIP, system security is undoubtedly one of the issues we care about most.
But with the appropriate configuration, and some basic safety habits, we can improve the security of the telephone system. Moreover, the powerful built-in firewall function in MyPBX is adequate to enable the system to run safely and stably. This guide will introduce the highest defense level in MyPBX, and we strongly recommend that you configure firewall and other security options according to this guide, to prevent the attack fraud and the system failure or calls loss.

1. Security Configuration for Web GUI

1.1 Change the default access port for HTTP on Options page

PBX→Basic Settings→General Preferences→HTTP Bind Port

![Figure B-1](image)

1.2 Change the default password for the web GUI

System→System Preferences→Change Password
2. Disable SSH on LAN Settings Page

2.1 Disable SSH

Select LAN Settings→Enable SSH. If external debugging isn’t required, please select “No”.

2.2 Change the default password for SSH

We can use the Linux command `passwd` to change root password of MyPBX.
1. Login via putty.exe
2. The default username is root and the default password is ys123456.

3. Use command `passwd` to change the root’s password

![Figure B-4]

![Figure B-5]

![Figure B-6]
3. Security Configuration for Extensions

3.1 Change the default SIP Port

PBX → Basic settings → SIP Settings → General → UDP Port

![SIP Settings Interface]

Figure B-7

3.2 Disable guest calls

PBX → Basic settings → SIP Settings → Advanced Settings → Allow Guest
3.3 Security Configuration for remote extensions

If remote registration isn’t required, please disable it.

PBX®Extensions®FXS/VoIP Extensions®VoIP Extensions®General®VoIP Settings

3.4 Set a robust password and enable IP restriction for extensions

1) Set a new extension password at a higher security level, e.g. AjK5Up1G.

PBX®Extensions®FXS/VoIP Extensions®VoIP Extensions®General®Password
2) Enable IP restriction and enter the permitted “IP address/Subnet mask”, e.g. 192.168.5.136.

4. Setup Proper Firewall Rules

**Note:** Please backup the configurations on backup and restore page before you go ahead. In the case that you lock the device, you can reset to factory default.
and restore the previous configurations.

**Step1.** Enable firewall on firewall page of MyPBX.

System→Firewall Settings→Firewall Rules→General Settings

![Figure B-12](image)

**Step2.** Add a common rule to accept local network access.

Create a common rule to allow all the IP addresses of the local phones to access MyPBX server. For example, if the IP addresses of the local network are 192.168.5.1-254, the configurations could be as below:

- **Name:** LocalNetwork
- **Protocol:** BOTH
- **Port:** 1-65535
- **IP:** 192.168.5.0/255.255.255.0
- **Action:** Accept

![Figure B-13](image)

**Step3.** Create common rules to accept remote extensions or remote
administrators, if you use a SIP trunk, please accept the provider’s host as well. **Note:** If there are no remote extensions, the rule is not required.

Set up the firewall rule to allow the public IP address of remote extensions to access MyPBX server. e.g. 110.111.132.6, the configurations could be as below:

**Name:** Remote Extension  
**Protocol:** BOTH  
**Port:** 1:65535  
**IP:** 110.111.132.6/255.255.255.255  
**Action:** Accept  

![Figure B-14](image)

**Step4.** Configure auto blacklist rules

Auto blacklist rules: the Server would add the IP address to the blacklist automatically if the number of the packets it sends exceeds the rule you configured.

Add two auto blacklist rules for port: 5060.

**Rule No.1:**
- **Port:** 5060  
- **Protocol:** UDP  
- **IP Packets:** 120  
- **Time Interval:** 60 seconds
Figure B-15

Rule No.2:
**Port**: 5060  
**Protocol**: UDP  
**IP Packets**: 40  
**Time Interval**: 2 seconds

Figure B-16

Add an auto blacklist rule for Port: 8022

Rule No.3  
**Port**: 8022  
**Protocol**: TCP  
**IP Packets**: 5  
**Time Interval**: 60 seconds

Figure B-17

**Step 5.** Add a Firewall Rule for VoIP trunk registration
Note: If there is no VoIP trunk, this rule is not required. And if the RTP IP address of VoIP trunk and Registration IP address of the VoIP trunk are different, we need to create a rule to accept the RTP IP address too.

Add a rule to accept the IP address of the VoIP trunk to access MyPBX server. For example: If the IP address of the VoIP trunk is 110.5.14.6, Protocol is UDP and Port is 5060, the configuration could be as below:

**Name**: VoIPTrunk  
**Protocol**: UDP  
**Port**: 5060: 5060  
**IP**: 110.5.14.6/255.255.255.255  
**Action**: Accept

![Edit Firewall Rule](image)

**Step 6.** Add a firewall rule to accept remote access of HTTP port. For example, if the remote access IP is 110.5.14.6, and the port is 80, the configuration could be as below.

**Name**: RemoteHTTP  
**Protocol**: TCP  
**Port**: 80:80  
**IP**: 110.5.14.6/255.255.255.255  
**Action**: Accept
Step 7. Add a firewall rule to accept remote access of SSH port. For example: if the remote access IP is 110.5.14.6 and the port is 8022.

Note: If the remote access of SSH port is not needed, this rule is not required.

Name: RemoteSSH  
Protocol: TCP  
Port: 8022:8022  
IP: 110.5.14.6/255.255.255.255  
Action: Accept

Step 8. Add other firewall rules by yourself. For example, if you are using
features related to email, you should add the firewall rules for the SMTP server and POP3 server.

**Step 9.** Enable Drop all (If this feature is enabled, all the packets and connection that do not match the rules would be dropped.)

**Note:** Before enable this feature, please add a rule to accept the local network access, or the server might not be accessed.

![General Preferences](image)

*Figure B-21*

**Step 10.** The Configuration of firewall settings is completed. See the figures below.
Step 11. Define the authorized data transmitting rate and drop all other unauthorized hosts.

Note: If we setup IP blacklist rules here, those unauthorized hosts will still be able to send SIP packets into MyPBX if the packets transmitting rate is under the rate defined. But as soon as the transmitting beyond the define rate, the IP will
be added into blacklist automatically. This is useful for remote extension who is using dynamic IP address.

Remove all the IP blacklist rules if you don’t allowed any other unauthorized hosts access MyPBX. See as below figure. **Note:** If “drop all” is not enabled, please don’t remove the IP blacklist rules in case the system security hole.

**Figure B-24**

**Figure B-25**
5. Alert Settings

After enabling alert settings, if the device is attacked, the system will alert the users via call or e-mail. The attack modes include IP attack and Web Login.

5.1 IPATTACK

When the system is attacked by some IP addresses, the firewall will add the IP to auto IP Blacklist and notify the user if it match the protection rule.

Example: Configure to notify extension 500, outbound number 5503301 and E-mail alert@yeastar.com. Configuration could be as below.

Phone Notification Settings:

Phone Notification: Yes
Number: 500;5503301
Attempts: 1
Interval: 60s
Prompt: default

Note: If there is an outbound number to notify, the number should fit the dial pattern of the outbound route.

E-mail Notification Settings:

E-mail Notification: Yes
To: alert@yeastar.com
Subject: IPAttack
5.2 WEBLOGIN

Enter the password incorrectly five times when logging in MyPBX Web interface will be deemed as attack, the system will limit the IP login within 10 minutes and notify the user.

Example: Configure to notify extension 500, outbound number 5503301 and E-mail alert@yeastar.com.
configuration could be as below.

Phone Notification Settings:
- **Phone Notification**: Yes
- **Number**: 500;5503301
- **Attempts**: 1
- **Interval**: 60s
- **Prompt**: default

**Note**: If there is an outbound number to notify, the number should fit the dial pattern of the outbound route.

E-mail Notification Settings:
- **E-mail Notification**: Yes
- **To**: alert@yeastar.com
- **Subject**: WebLogin
APPENDIX C How to Configure External Storage

Before External storage can be properly configured, an SMB share folder accessible from MyPBX must be set up on a Windows based machine. Once that has been set up, please follow the steps below.

**Step 1** Add a new folder, rename it, and set this new folder’s share Properties according to Figure C-1.
Step 2 Enter the new folder and create a new text file, then rename this file to status.txt. This step is very important, DO NOT forget to create the status.txt file.

Step 3 Configure external storage settings on MyPBX to Figure C-2.
Net-Disk Host/IP: Change this to the IP address of the computer where backup files will be stored.

Net-Disk Share Name: Change this to the name of the shared folder where backups will be stored.

Net-Disk Share Username: The user name used to log into the network share. Leave this blank if it is not required

Net-Disk Share Password: The password used to log into the network share. Leave this blank if it is not required

Open your Windows share folder to see if the MyPBX backup files and folders has been created. If the contents of the backup folder look similar to Figure C-3, then you have successfully configured External storage on the MyPBX unit.

APPENDIX D How to Configure NAT Setting

When MyPBX is behind a NAT (firewall), you need to configure NAT setting on MyPBX if you want to use a remote extension.

Please follow section 1 or 2 below depending on your network configuration.

1. If MyPBX is connected to a local network, you must set up port forwarding on your router. Specifically, you must map port 5060 (default SIP port) and port 10001-10200 (default RTP port range) as UDP ports.

Next, log in MyPBX Web GUI, go to “PBX” -> “Advanced Settings” -> “SIP Settings” -> “NAT”.

External IP Address: your router’s public IP address

External Host: your router’s domain
**External Refresh Interval**: 20 seconds

**Local Network Identification**: 192.168.5.0/255.255.255.0 (change this according to your network configuration)

**NAT mode**: Yes

**Allow RTP Reinvite**: Yes

Assuming that your router’s host address is yeastar.3322.org, your local network is from 192.168.5.1 – 192.168.5.254, and the subnet Mask is 255.255.255.0, the MyPBX network settings should be configured like Figure D-2.

2. If MyPBX has a public IP (i.e. is connected directly to your internet service provider), the network settings should be configured according to Figure D-3:
Now, MyPBX has been configured as a public IP, so there is no need to configure NAT again, just leave all settings in “NAT” blank.

APPENDIX E How to Use Auto Provision

**Step1.** Disable DHCP Server on your local network.
E.g. Disable DHCP Server on Linksys Router.
Step2. Enable DHCP Server on MyPBX.
Login MyPBX web interface, “System”→“Network Preferences” →“DHCP Server”→“Enable DHCP Server”.

FigureE-1

FigureE-2
**Step 3.** Configure phones on MyPBX auto-provision page.

1. Login MyPBX web interface, “PBX” -> “Extensions” -> “Phone Provisioning” -> “Add Phone”.

![Image](image_url)

**Figure E-3**

2. Fill in the phone detail message on the pop-up windows. Input IP Phone’s MAC address, configure Name, Call waiting, Line, Extension, Label, Line active for the phone. And also you can configure other features on the phone, like codecs, memory keys etc.
Step4. Turn on the power and connect the network cable to IP Phone.

Remark: The factory default setting of DHCP for IP Phone is enabled, so you can skip this step to step 5.

If the DHCP is disabled, please follow the steps below to enable it (e.g. Yealink’s IP Phone).
1. Login IP phone’s Web page.
2. Enable DHCP.

Step5. Finish.
APPENDIX F How Do I Configure Distinctive Ring Tones

Step 1: On your IP phone, navigate to the Phone settings web configuration page and find the Distinctive Ring Tone section. For each custom ring tone, enter the Internal Ringer Text (can be digits or text) to trigger the ring tone. For example, you may enter “Family”. E.g. Yealink’s IP phone.

Step 2. Configure the “Distinctive Ringtone” on MyPBX. Log in MyPBX web interface, “PBX” -> “Inbound Call Control” -> “Inbound Routes” -> Edit Inbound Route, fill in the Internal Ringer Text on “Distinctive Ringtone”.

Figure F-1
**Step3.** Finish.
APPENDIX G How to Use Email to SMS

How to use Email to SMS
You need to send an email to the specified email address (you set in Email Settings. In this case, it is lears@yeastar.com). The content of this email will be sent to the number you want as a message. The subject (title) of the email will determine the number. Here are some examples of the formats to the subject of the email.

Example:
1. **Send message with no PIN code and default GSM port.**
   **Format:** phonenum
   If the subject is "12345678", the text of this email ("Welcome to Yeastar!") will be sent to number "12345678" through the first available GSM trunk (No PIN code should be set by administrator).

![FigureG-1](image1)

2. **Send message with no PIN code and specified GSM port.**
   **Format:** port:portnumber-phonenum
   If the subject is "port:9-12345678", the text of this email ("Welcome to Yeastar!") will be sent to the number "12345678" through GSM trunk 9 (No PIN code should be set by administrator).

![FigureG-2](image2)
3. Send message with PIN code and default GSM port.
**Format:** 500:pincodenumber-phononenumber
If the subject is "500:987-12345678", the text of this email ("Welcome to Yeastar!") will be sent to number "12345678" through the first available GSM trunk ("987" is the PIN code set by administrator).

![FigureG-3](image)

4. Send message with PIN code and specified GSM port.
**Format:** 500:pincodenumber-port:portnumber-phononenumber
If the subject is "500:987-port:9-12345678", the text of this email ("Welcome to Yeastar!") will be sent to number "12345678" through GSM trunk 9 ("987" is the PIN code set by administrator).

![FigureG-4](image)

**APPENDIX H How to Use DID**

Direct inward dialing (DID), also called direct dial-in (DDI) in Europe and
Oceania, is a feature offered by telephone companies for use with their customers' private branch exchange (PBX) systems. In DID service the telephone company provides one or more trunk lines to the customer for connection to the customer's PBX and allocates a range of telephone numbers to this line (or group of lines) and forwards all calls to such numbers via the trunk.

MyPBX support DID, you can configure DID in inbound route. Related settings: **DID Number, Extension, Destination.**

**Figure H-1**

**DID Number**
Define the expected DID Number if this trunk passes DID on incoming calls. Leave this field blank to match calls with any or no DID info. Only service provider, E1 trunks, BRI trunks or SIP trunks need to be configured with this setting.
You can also use pattern matching to match a range of numbers. The following patterns may be used:

- **X**: Any Digit from 0-9
- **Z**: Any Digit from 1-9
- **N**: Any Digit from 2-9
- **[12345-9]**: Any digit in the brackets (in this example, 1, 2, 3, 4, 5, 6, 7, 8, 9)
The “.” Character will match any remaining digits. For example, “9011.” will match any phone number that starts with "9011", excluding "9011" itself.
The “!” will match none remaining digits, and causes the matching process to complete as soon as it can be determined that no other matches are possible.
**·Extension**
Define the extension for DID number, this field only valid when use E1 trunk for this inbound router. You can only input number and “-” in this field, and the format can be xxx or xxx-xxx. The count of the number must be only one or equal the count of the DID number.

**·Destination**
If you don’t set the extension, you can set the destination of the call here.

**Example 1:**
Step1: You set the DID number (5503XXX in this example).
Step2: You choose the destination (IVR in this example).

The configuration of this example means when the incoming call with DID number 5503XXX (7-digit numbers starting with 5503) will go to the destination IVR.

If you choose the destination, please leave the Extension form blank.
Example 2:
Step1: You set the DID number (6001-6099 in this example).
Step2: You set the Extension (6001-6099 in this example).

The configuration of this example means when the incoming call with DID number 6001 to 6099 will go to the destination 6001 to 6099 (number 6001 to extension 6001, number 6002 to extension 6002).

The destination you set below will be disabled if you set the Extension.
APPENDIX I How to Use BLF Key to
Choose the PSTN Line
MyPBX allows you to choose the specific PSTN line to make outbound call by pressing the BLF key on the IP Phone.

Follow the steps to do the configuration with your Yealink phone.

1. We want to choose pstn1 or pstn2 to call out.

![FigureI-1](image)

2. Configure the IP Phone:

![FigureI-2](image)

Test
When you press DSS Key 1/2, the phone will connect to pstn1/pstn2 line. If pstn1/pstn2 is not busy, you will hear the dial tone. You can dial the number you want and use this line to call out then.
APPENDIX J How to Set up Auto Recording

MyPBX U5XX allows you to record the calls automatically. Here is the guide for you to use it.

1. Login

From your web browser, input the IP address of the MyPBX server. Login the system with the monitor account:

   **User Name**: monitor
   **Password**: password

![Login Screen](image)  
*Figure J-1*

**Note:**

MyPBX firmware upgrade follow-up
- Reboot the device twice to make the new firmware take effect
- Clean the cache and cookies of the browser before login.
- There is a compatibility issue with IE11. Configure IE11 browser "Compatibility View Settings", add MyPBX IP address, and check "Display Intranet sites in Compatibility View" and "Use Microsoft compatibility lists".

See the following picture. MyPBX IP is 192.168.5.250 in this example.
2. Recording Settings

1) General Preferences

**Note:** Before enabling call recording, please make sure that the USB storage or the Net Disk performs well.

- **Enable Call Recording**
  Enable this function here. You can tick:
  a. Record Inbound calls
b. Record Outbound calls  
c. Record Internal calls  
d. Record Callback calls  
e. Record Conferences calls.

**Storage Location**  
After enabling Call recording, you can choose where to store the recordings, in the Network Disk or in the USB.

**Record Outbound Prompt**  
If call recording is enabled, the callee of outbound calls will hear the preconfigured prompt reminding them that the conversation is being recorded. If you tick the option “Written to the Recording file”, the prompt will be written in the recording file.

2) Apply To  
**Trunks Recording**  
When ticked, all calls through the selected trunks will be recorded.

**Extensions Recording**  
When ticked, all calls made by the selected extensions will be recorded.

**Conferences Recording**  
When ticked, all conversations through the selected conferences will be recorded.
3. Advanced Settings

3.1 Share settings

Configure this setting to share the recording file on the network.

- **User Name**
  The user name to access the files

- **Password**
  The password for the user name

- **Share Name**
  The name of the folder showed on the network.
For WIN 7/Vista user. please modify the registry before checking the shared file:

Step1: Start->Run->regedit
Step2: Modify the value of
"HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Lsa\LmCompatibilityLevel" to "1".
If “LmCompatibilityLevel” doesn’t exit, create a Dword value
"LmCompatibilityLevel " = 1

You can check the recording file on the network by Explorer/Resource Manager
Run: \ \ IP of MyPBX
In the picture below, the IP is 192.168.5.149
If you change the password of the share folder, the network users may not be able to check the shared files then.

Please ask the network user to try:
step1: Start-> Run -> cmd
step2: net use * /del (there is a space behind *)
step3: Visit the device again with the new password

3.2 Password Setting

You can change the password of the account "monitor" here.
3.3 Network Disk Settings

The Network Disk feature is used to extend storage space. If “Storage Location” is set to Network Disk, the call recording files created will be moved to the Net Disk.

Note: The shared folder must be based on Windows Operation System. And if it's windows Vista/2008/7, please add “Everyone” into the shared account list. After that you should ensure that the permission of “Everyone” is checked.

![Figure 3-9](image-url)
Before network disk can be properly configured, an SMB share folder accessible from MyPBX must be set up on a Windows based machine. Once that has been set up, please follow the steps below.

**Step 1**: Choose a window-based computer that is always in service
**Step 2**: Create a folder
**Step 3**: Share this folder
Then we need input the Net-Disk information in “Connect to Network Disk“ tab.

![Network Disk settings](Figure J-12)

**Running Status:** It will show the status of Network disk.

**Net-Disk Host/IP:** Change this to the IP address of the computer where files will be stored.

**Net-Disk Share Name:** Change this to the name of the shared folder where files will be stored.

**Net-Disk Share Username:** The user name used to log into the network share. Leave this blank if it is not required. In general, you use the administrator account on PC as a user name here.

**Net-Disk Share Password:** The password used to log into the network share. Leave this blank if it is not required.

If the configuration is correct, you will see the Network Disk information.

![Network Disk settings](Figure J-13)

Then make some calls through trunks or extensions. After that, you can see the recordings in the sharing folder.
3.4 Auto Recording Management

This feature defines whether extensions can check the call recordings or not when log into MyPBX’s web interface using its extension number and the voicemail PIN, we can also set the permissions for call recording management.

- **Manager**
  Choose extension number of the manager. Manager can check the call recordings of the selected extensions in the “Allowed Extensions” on the Web User Interface.
· **Enable Auto Recording check**
The permission to view recordings

· **Recording numbers allowed to check**
The number of recordings that users can check. If enter “0” or leave this blank empty, the number will not be limited. Enter “3”, for example, the manager can check the latest 3 recordings at most.
Note: The oldest recording will be covered by the latest recording.

· **Auto Recording Delete Permission**
The permission of deleting recording

· **Auto Recording Download Permission**
The permission of downloading recording

· **Allowed Extensions**
You can decide which extension’s call will be recorded.

For example, we set the extension 101 as a manager and set yes for “Enable Auto Recording check”. And select 102,103 as allowed extensions. Then tick “Allow Record Internal”. Finally, we make a call from 102 to 103. As a result, if you log in Web User Interface of extension 101, you can check recording logs in “Auto Recording” page. But if you login by 102 or 103, you can’t find the auto recordings since it doesn’t have the permission.
4. Report

4.1 Record Logs

You can check all of the recordings of calls made through MyPBX when you log in by “Monitor” account.

- **Attention**
  The system will detect old CDR files after CDR system update. If there exists old CDR files, system will give you the prompt that whether you want to import the old files or not. If selection is done, this “Attention” will disappear.

![Figure J-17](image)

- **Start Search**
  You are able to search the recording by Start Date to End Date, Extension, Trunk, Duration and Communication Type.

- **The Recording List**
  You can check the ID, Time, Callee, Caller, Trunk, Duration (second), Communication Type of each recording.
  You can play, download or delete the recording files.

APPENDIX K How to use LDAP

LDAP stands for Lightweight Directory Access Protocol, which is a client-server protocol for accessing a directory service. Normally, it is used as a phone book on MyPBX so that you can search a key word from your IP phone. Here we take Yealink T-28 IP phone as an example.

1. Configuration on MyPBX.
   Tick the option of "Enable LDAP", and use default configuration in the other fields.

   **Default configuration as below:**

   Root Node: dc=pbx,dc=com
   PBX Node: ou=pbx,dc=pbx,dc=com
   User Name: cn=admin,dc=pbx,dc=com
   Password: (fill in as required)

   Then you can add contacts as required.

   ![Figure K-1](image)

2. Configuration on Yealink T-28 IP phone
First fill the fields as the configuration as below:

LDAP Name Filter:   (|(cn=%)(sn=%%))
LDAP Number Filter: (|(telephoneNumber=%)(homePhone=%)(mobile=%%))
Server Address:     192.168.5.142 /the IP of MyPBX/
Port:      389
Base:                dc= yeastar,dc=cn
User Name:          cn=admin,dc=yeastar,dc=com
Password:            *****/the password you have set on MyPBX/ Max.Hits:    50
LDAP Name Attributes:       cn sn displayName
LDAP Number Attributes:     telephoneNumber homePhone mobile mail departmentNumber
LDAP Display Name:           %cn
Protocol:                          Version 3
Search Delay(ms)(0~2000):       0
LDAP Lookup for Incoming Call:    Enabled
LDAP Sorting Results:              Enabled
LDAP Lookup for PreDial/Dial:      Enabled

Click the “confirm” button, and the LDAP will take effect.

Then configure the DSS Key for linking to the LDAP setting.
If you enable the "LDAP Lookup for PreDial/Dial", you can use LDAP feature either in PreDial/Dial page or by pressing DSS Key.
